

ING Bank

Additional Pillar III Report 2018

Additional Pillar III Report

amounts in millions of euros, unless stated otherwise

Navigation map

The index below enables the readers to track the main risk items through the various risk disclosures.

Risk management			
	Subjects	Risk Management	Pillar III
These sections show ING's approach to risk management.	Introduction to risk section	175	
	Introduction to Pillar III		4
	Purpose and business model	175	
	Risk governance	175	
	Risk management function and risk culture	178	
	Risk profile	180	
	Risk appetite framework and stress testing	182	
	Regulatory environment	185	4
	Top and emerging risks	185	
Credit risk			
	Subjects	Risk Management	Pillar III
Credit risk is the risk of potential loss due to default by ING's debtors (including bond issuers) or trading counterparties.	Governance and credit risk definitions	187	14
	Credit risk appetite and concentration risk framework	190	
	Environmental and Social Risk Framework	191	
	Credit risk capital and measurement (SA & AIRB)		16
	Economic and Regulatory Capital		16
	RWA comparison		16
	Credit risk tools	195	18
	Credit risk portfolio	196	21, 44
	Credit risk mitigation	203	53
	Credit quality	214	35
	Securitisations	225	54
Market risk			
	Subjects	Risk Management	Pillar III
Market risk is the risk of potential loss due to adverse movements in market variables.	Governance	225	
	RWA under IMA		59
	Economic Capital	227	
	Market risk in banking books	227	
	Market risk in trading books	234	
Funding and liquidity risk			
	Subjects	Risk Management	Pillar III
Funding and liquidity risk is the risk that ING cannot meet the financial liabilities when they come due, at reasonable cost and in a timely manner.	Governance	240	
	Management	241	
	Funding profile	241	
	Asset encumbrance		59

Non-financial risk

	Subjects	Risk Management	Pillar III
Operational risk is the risk of direct or indirect loss returning from inadequate or failed internal processes, people and systems or from external events.	Governance	244	
	Framework	245	
Compliance risk is the risk of impairment of ING's integrity, leading to damage to ING's reputation, legal or regulatory sanctions, or financial loss, as a result of failure (or perceived failure) to comply with applicable laws, regulations, ING policies and minimum standards and the ING values.	Operational risk and main developments	246	61
	Compliance risk and main developments	248	62
	Non-financial risk awareness	253	

Business risk

	Subjects	Risk Management	Pillar III
Business risk is the exposure to value loss due to fluctuations in volumes, margins and costs, as well as customers' behaviour risk.	Introduction	254	
	Governance	254	

Introduction

Basis of disclosure

The information in this report relates to ING Bank N.V. and all of its subsidiaries (hereafter ING Bank). There are no differences between the scope of consolidation for prudential purposes and the scope of consolidation for accounting purposes as reported in the annual accounts in Note 1 'Accounting policies', Note 46 'Principal subsidiaries' and Note 47 'Structured entities'

Assurance/validity

The Pillar III disclosures have been subject to ING's internal control assessments and validation mechanisms, to ensure compliance with laws and regulations. The Disclosure Committee (DisCom), responsible for all ING Group disclosures, assesses the accuracy of the content before reporting their conclusions to the Audit Committee (AC) for review and submission to the Supervisory Board for final approval. This report has not been audited by ING Group's external auditor.

Regulatory framework

In 2010, the Basel III framework was adopted and consequently translated in the European Union (EU) into regulation through the Capital Requirement Regulation (CRR) and Capital Requirement Directive IV (CRD IV). The CRR is binding for all EU member states and became effective per 1 January 2014.

The Basel Committee's framework is based on three pillars. Pillar I on minimum capital requirements, which defines the rules for the calculation of credit, market and operational risk. Pillar II, for risks not included in Pillar I, is about Supervisory Review and Evaluation Process (SREP), which requires banks to undertake an internal capital adequacy assessment process (ICAAP) to identify and assess risks and maintain sufficient capital to face these risks, and an internal liquidity adequacy assessment process (ILAAP) focusing on maintaining sufficient liquidity (and funding) risk management. Pillar III is on market discipline and transparency, requiring disclosures to allow investors and other market participants to understand the risk profiles of individual banks.

ING Bank prepares the Pillar III report in accordance with the CRR and CRD IV as required by the supervisory authority. ING Group's 'Additional Pillar III Report' contains disclosures for regulatory capital requirements, credit risk, including counterparty credit risk, securitisations and other non-credit obligation assets (ONCOA), market risk, liquidity risk and non-financial risk disclosures. Furthermore, the report will discuss regulatory exposures and risk weighted assets. For more information on these topics, we refer you to the Risk Management and Capital Management sections of the Annual Report, which present a comprehensive discussion on both topics.

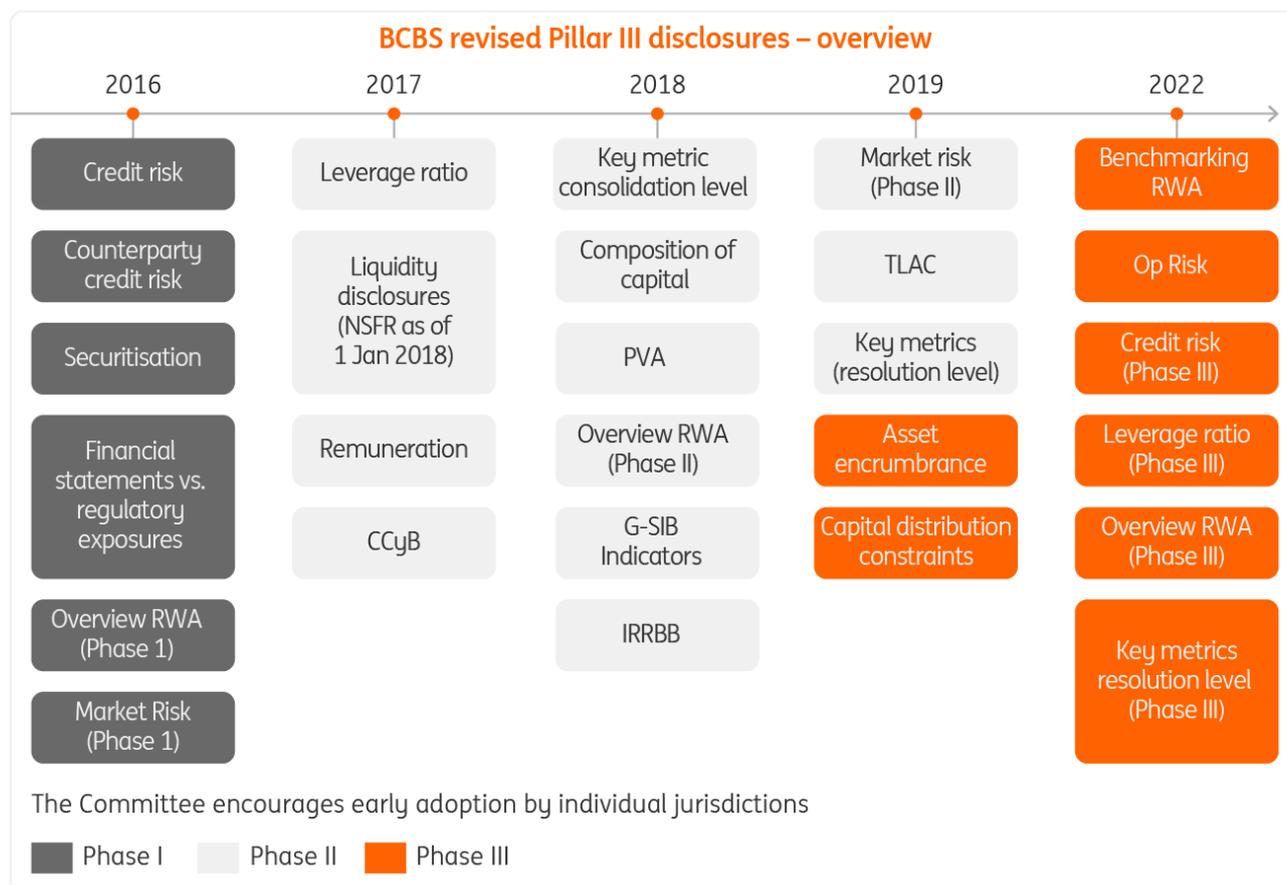

The Pillar III report is published on an annual basis. However, some capital requirements as laid down in Article 438 as well as information on risk exposure or other items prone to rapid change are disclosed on a quarterly or semi-annual basis. Some subsidiaries publish information on capital and solvency on their websites or annual reports pursuant to local regulatory requirements.

Developments in disclosure requirements

BCBS Revised Pillar III framework (RPF)

With respect to market information disclosures, the Basel Committee on Banking Supervision (BCBS) announced in 2014 its ambition to revise and consolidate the Pillar III disclosure requirements. The BCBS published in December 2018 updated Pillar 3 disclosure requirements. These requirements, together with the updates published in January 2015 and March 2017, complete the Pillar 3 framework. They set out (i) additional disclosure requirements to the Pillar III framework arising from the finalisation of the Basel III post-crisis regulatory reforms in December 2017, such as new disclosure requirements to benchmark the risk-weighted asset (RWA) outcomes of banks' internal models with RWA calculated according to the standardised approaches, (ii) new disclosures for asset encumbrance, (iii) new disclosures on capital distribution constraints (when required by national supervisors at the jurisdictional level) and (iv) amendments to the scope of application of disclosures on the composition of regulatory capital to expand it to resolution groups, instead of the current scope being the consolidated level.

The revised Pillar III framework (RPF) is the result of an extensive review of Pillar III reports, in which the existing Pillar III disclosure requirements are superseded. The result applies to internationally active banks at the highest consolidated level. The implementation timeline, as displayed in the total overview of the RPF below, is highly dependent upon the finalisation of the underlying regulatory standards.

European Regulation

CRR/CRD IV review

On 23 November 2016, the European Commission (EC) published proposals amending major European regulations for the CRD IV and CRR essential to further reinforce banks' ability to withstand potential shocks, among others. For the disclosure requirements, the Commission proposed targeted amendments to ensure better alignment with international standards. In particular, new disclosure requirements are proposed for TLAC, counterparty credit risk, market risk and liquidity requirements. On 25 October 2017, it was announced that the European Parliament, the Council and the Commission agreed on elements of the review of the CRR and CRD proposed in November 2016. The first consolidated CRR text with the amendments to the initial Commission's Proposal has been shared with the delegations.

Further, the European Banking Authority (EBA) is mandated to develop uniform disclosure formats to enhance comparability, and ING's management is required to verify and sign-off on compliance with disclosure requirements and the adherence to internal policies on disclosure.

EBA guidelines on disclosure requirements under Part Eight of Regulation (EU) 575/2013 (EBA/GL/2016/11)

The EBA issued a final paper (EBA guidelines 2016/11) on the guidelines on CRR disclosure requirements in order to allow EU institutions to implement the RPF in a way that is compliant with the requirements of Part Eight of the CRR. A second version was issued on 9 June 2017 with some slight amendments to reflect legislation updates.

The EBA guidelines should therefore be seen as specifications of the existing CRR disclosure requirements, rather than a completely new set of requirements. In line with the recommendations provided in the guidelines, a compilation of the quantitative information is disclosed on the corporate website [ing.com](http://www.ing.com/About-us/Annual-Reporting-Suite.htm). <http://www.ing.com/About-us/Annual-Reporting-Suite.htm>

The scope of the EBA guidelines and format of the disclosures correspond almost fully with the RPF, focusing on general disclosure requirements for risk management, credit risk, counterparty credit risk and market risk. Although in scope of the RPF, securitisation and other requirements in Part Eight of the CRR, for which there are already delegated or implemented regulations or guidelines, were left out at this stage.

The table below “Disclosure index EBA guidelines” indicates where the templates from the EBA guidelines 2016/11 are located in the Pillar III report and/or the annual report:

Disclosure index EBA guidelines			
Type	ID	EBA description	Pages
Capital requirements	EU OV1	Regulatory capital requirements	8
	EU CR10	IRB (specialised lending and equities)	58
Credit risk and general information on CRM	EU CR8	RWA flow statement of credit risk exposures under the IRB approach	15

EU Commission adopted RTS for asset encumbrance (AE) disclosure

On 13 December 2017, the EU Commission adopted a Commission Delegated Regulation supplementing the CRR with regard to Regulatory Technical Standards (RTS) for disclosure of encumbered and unencumbered assets (article 443 of the CRR). Based on the RTS and building on the EBA disclosure guidelines, the Commission Delegated Regulation sets out the data required for asset encumbrance disclosure. It is introducing additional items to the current disclosure of AE being (i) additional information on the asset type (article 1) and (ii) inclusion of EHQLA/HQLA as an asset quality indicator (article 2). The Commission Delegated Regulation entered into force on 2 January 2018 replacing the current EBA Guidelines on the disclosure of encumbered and unencumbered assets. However, the application of additional disclosure requirements concerning asset quality indicators (article 2) has been deferred by one year so that institutions can develop necessary IT systems.

EBA guidelines on IFRS 9

In January 2018, the EBA published its final guidelines on disclosure requirements of IFRS 9 or analogous expected credit losses (ECLs) transitional arrangements. The guidelines specify a uniform disclosure template institutions shall use when disclosing the information on own funds, capital and leverage ratios, with and without the application of transitional arrangements for IFRS 9 or ECLs. The aim of these guidelines is to ensure consistency and comparability of the data disclosed by institutions during the transition to the full implementation of the new accounting standard and to foster market discipline. These guidelines have been drafted in accordance with article 473a, paragraph 10 of the CRR, which mandates the EBA to issue guidelines on the disclosure requirements laid down in the same article.

ING Group has decided not to apply the CRR transitional arrangements for mitigating the impact of the introduction of IFRS 9 impairment on own funds. Therefore, the capital and leverage ratios published as from reporting period 1 January 2018 fully reflect the impact of impairment requirements resulting from IFRS 9. More information on the implementation and impact of the adoption of IFRS 9 by ING is available in Note 1 'accounting policies' part of the Consolidated Annual Accounts.

Public disclosure of return on assets

The CRD IV requires ING Group to disclose information on its return on assets. ING Group has decided to calculate ROA based on underlying results and average assets derived from quarter-end assets to align it with the other indicators. The underlying ROA represents profit as a percentage of average total assets. In 2018, the underlying ROA remained stable at 0.62% (in 2017: 0.58%).

Capital requirement

Economic and Regulatory Capital

Economic Capital (EC) and Regulatory Capital (RC) are the main sources of capital allocation within ING. Both of these capital metrics are used to determine the amount of capital that a transaction or business unit requires to support the economic and regulatory-based risks it faces. The concept of EC differs from RC in the sense that RC is the mandatory amount of capital that is defined under Pillar I while EC is the best estimate of Pillar II capital that ING uses internally to manage its own risk. EC is a non-accounting measure that is inherently subject to dynamic changes and updated as a result of ING's portfolio mix and general market developments. ING continuously recalibrates the underlying assumptions behind its EC model which may have an impact on the values of EC going forward. In the course of 2018 ING has conducted a thorough review of its EC Framework, aimed at redefining key design principles and exploring which role EC is to play in business planning and decision making. These design principles as well as the role of EC in business planning and decision making will be implemented in the next years.

EC is defined as the amount of capital that a transaction or business unit requires in order to support the economic risks it takes. EC focuses on the bank activities on a ING Bank consolidated level and is therefore only available per that scope. In general, EC is measured as the unexpected loss above the expected loss at a given confidence level. The EC calculation is used as part of the CRR/CRD IV Pillar II Internal Capital Adequacy Assessment Process (ICAAP) and the Supervisory Review and Evaluation Process (SREP) that is performed regularly by the supervisor.

The following fundamental principles and definitions have been established for the model:

- ING Bank uses a one-sided confidence level of 99.95% and a one-year time horizon to calculate EC;
- It is assumed that all currently known measurable sources of risk are included;
- The best estimate risk assumptions are as objective as possible and based on thorough statistical analysis;
- The EC calculations reflect known embedded options and the influence of customer behaviour in banking products;
- The EC calculations are on a before tax basis and do not consider the effect of regulatory requirements on capital levels; and
- The framework does not include any franchise value of the business, discretionary management intervention or future business volumes and margins.

Capital Adequacy Rules – CRR/CRD IV

The rules for required Regulatory Capital or Capital adequacy are based on the guidelines developed by the Basel Committee on Banking Supervision (The Basel Committee) and the European Union Regulation and Directives, as implemented by the European Central Bank and the Dutch Central Bank for supervisory purposes.

The rules express the regulators' and legislators' opinions of how much capital a bank and other regulated credit institutions must retain in relation to the size and the type of risk taking expressed in the form of risk-weighted assets. The most important part of the capital base is the shareholders' equity. In addition to equity, the institution may issue certain liabilities such as Tier 1 and Tier 2 instruments to be included in the capital base. The legal minimum requirement (excluding buffers) stipulates that the capital base must correspond to at least 8% of the Risk-Weighted Assets (RWA).

The table below presents an overview of the Minimum capital requirements and the RWA at year end 2018 per type of risk and method of calculation. The largest part of the RWA is related to credit risk (85%) and mainly to the portfolio with calculations based on the Advanced Internal Ratings Based (AIRB) approach. More information on credit RWA is given in the following chapter "Credit risk".

EU OV1: ING Bank Regulatory capital requirements

	RWA		Minimum capital requirements
	2018	2017	2018
Credit risk (excluding counterparty credit risk) (CCR)	252,795	242,100	20,224
Of which standardised approach (SA)	25,713	26,122	2,057
Of which internal rating-based (IRB) approach	223,229	212,084	17,858
Of which Equity IRB under the simple risk-weight or the internal models approach	3,853	3,894	308
Counterparty credit risk (CCR)	9,427	12,338	754
Of which Marked to market	8,380	8,753	670
of which standardised approach for counterparty credit risk	250	454	20
Of which risk exposure amount for contributions to the default fund of a CCP	245	376	20
Of which CVA	553	2,754	44
Settlement risk			
Securitisation exposures in banking book (after cap)	728	628	58
Of which IRB approach (RBA)	728	628	58
Market risk	6,508	4,752	521
Of which standardised approach (SA)	1,131	1,148	90
Of which internal model approaches (IMA)	5,378	3,604	430
Large exposures			
Operational risk	35,522	40,093	2,842
Of which Advanced Measurement Approach	35,522	40,093	2,842
Amounts below the thresholds for deduction (subject to 250% risk weight)	8,591	9,376	687
Floor adjustment			
Total	313,572	309,287	25,086

The increase in RWA is mainly driven by an increase in RWA for credit risk (excl. CCR) and market risk, which was partly offset by decrease in RWA for counterparty credit risk and operational risk.

ING Bank Regulatory Capital flow statement

Closing amount	8,316	8,314	11,042	11,133	
Total Regulatory Capital	53,988	53,933	56,259	56,751	

Capital position

As at 1 January 2014, the CRR/CRD IV capital rules entered into force. According to CRR/CRD IV capital adequacy rules, the Common Equity Tier 1 ratio has to be at least 4.5%, the Tier 1 ratio at least 6% and the total capital ratio at least 8% of all risk-weighted assets.

The capital position table reflects own funds according to the CRR/CRD IV rules. As CRD IV is phased in gradually until 2019, the table shows the CRD IV positions both according to the 2019 end-state rules and the 2018 rules. This makes clear which items phase in directly, which phase in gradually.

ING Bank's capital consists of Tier 1 capital and Tier 2 capital net after deductions. Tier 1 capital consists of both Common Equity Tier 1 capital and other Tier 1 capital, also referred to as hybrid capital. Tier 2 capital consists mostly of subordinated loans.

ING Bank Capital position				
	2018		2017	
	2018 rules (CRR/CRD IV phased in)	2019 rules (CRR/CRD IV fully loaded)	2017 rules (CRR/CRD IV phased in)	2019 rules (CRR/CRD IV fully loaded)

BIS capital	53,988	53,933	56,259	56,751
Risk-weighted assets	313,572	313,572	309,287	309,287
Common Equity Tier 1 ratio	12.89%	12.88%	13.13%	13.12%
Tier 1 ratio	14.56%	14.55%	14.62%	14.75%
Total capital ratio	17.22%	17.20%	18.19%	18.35%

1 Intangibles: mainly capitalised software.

2 Assuming that non CRR/CRD IV eligible Tier 1 and Tier 2 capital will be replaced by CRR/CRD IV eligible equivalents before they stop to meet the CRR/CRD IV grandfathering conditions. Future Tier 2 instruments will be issued by ING Group.

Own funds

The CRR requires ING Bank to disclose information on own funds in a specific format that was provided in the EBA Implementation Technical Standards. The EBA templates Annex I, II and Annex VI are disclosed on the corporate website [ing.com](http://www.ing.com).

<http://www.ing.com/About-us/Annual-Reporting-Suite.htm>

Countercyclical buffer

As only a few countries had set a countercyclical buffer rate larger than zero and ING Bank's exposures in these countries is relatively small, the resulting countercyclical buffer is also small: 0.056% in 2018. See below for an overview of the exposure distribution for the most relevant countries (having a share larger than 1% and/or having in place or announced a positive countercyclical buffer rate).

Countercyclical buffer

Leverage ratio

The Leverage ratio is a CRR/CRD IV measure indicating the level of the Tier 1 Capital compared to the total exposure. Its aim is to assess the risk of excessive leverage of the institution. In line with the regulatory requirements, ING Bank will use the specific EBA templates as basis for the presentation of its Leverage ratio. These EBA templates reflect the Leverage ratio as calculated under the Leverage ratio Delegated Act which was introduced in October 2014. The Final Draft Implementing Technical Standards (ITS) on disclosure of the leverage ratio have been approved by the European Commission and published in the EU Official Journal early 2016. The official reporting of the Delegated Act Leverage ratio to the ECB has commenced per September 2016. The fully loaded leverage ratio of ING Bank based on the Delegated Act, and with notional cash pooling grossed is 3.9% at 31 December 2018.

Disclosure on qualitative items

1	Description of the processes used to manage the risk of excessive leverage	ING follows the leverage ratio on a monthly basis and takes it into account when taking certain securitisation and/or Tier 1 issuance decisions.
2	Description of the factors that had an impact on the leverage ratio during the period to which the disclosed leverage ratio refers	The change in leverage ratio was mainly due to the increase of the total exposure measure as result of the growth of the balance sheet and growth in off-balance commitments.

Credit Risk

Basis and scope of presentation

In the credit risk section of Pillar III, data included in the tables are related to ING's credit risk resulting from Lending (both on- and off-balance), Money Market activities, Investment Risks, Securities Financing and Derivatives. The Securities Financing and Derivatives portfolios are presented separately in the counterparty credit risk section.

The amounts presented in this section relate to amounts used for credit risk management purposes, which follow ING's internal interpretation of the definitions as prescribed under CRR/CRD IV. Therefore, the numbers can be different from the accounting numbers as reported in the annual accounts under IFRS-EU. An example is the treatment of ONCOA (Other Non-Credit Obligation Assets) items - while the accounting numbers include ONCOA, they are excluded from the credit risk section of Pillar III.

The majority of the tables included in this section are based on gross or net carrying value. The gross carrying value refers to the original exposure pre-credit conversion factors for the on- and off-balance sheet items. The net carrying value corresponds to the original exposure (on- and off-balance) pre-credit conversion factors corrected for allowances, impairments and provisions.

READ is the Regulatory Exposure at Default (READ) and credit risk weighted assets (RWA) under the CRR/CRD IV definitions. READ is the sum of the on-balance and off-balance sheet: Lending, Investment, Money Market and counterparty activities plus an estimated portion of the unused credit facilities extended to the obligor. The amounts associated with Investment and Lending activities are based on the original amount invested less repayments.

Figures for Derivatives and Securities Financing are based on the Current Exposure Method, which is equal to the marked-to-market value of the underlying trades plus a (regulatory defined) 'add-on' which represents estimated potential future exposure (PFE). The amounts are adjusted based on the underlying collateral and any legal netting or compensation that may be permitted under master agreement arrangements such as International Swaps and Derivatives Association (ISDA) master agreements and Credit Support Annexes (CSAs).

Off-balance sheet exposures include letters of credit and guarantees, which are associated with the Lending risk category and are included under 'credit risk outstanding'. Additionally, off-balance sheet exposures include a portion of the unused limits, which represent the expected value of the outstanding at the theoretical moment of default. These are not counted under 'credit risk outstanding' but they contribute to total exposure and READ.

Exposures associated with Securitisations (Asset Backed Financing, Commercial / Residential Mortgage Backed Securities) are shown separately because of their specific treatment. These amounts also relate to the amount invested prior to any impairment or mark-to-market adjustments. These amounts are also considered to be 'Credit Risk outstandings'.

Investments in a financial sector entity, determined following art. 43 of the CRR, are included in the item "amounts below the thresholds for deduction" of table EU-OV1 "ING Bank Regulatory capital requirements" up to the level at which the combined significant investments are less than or equal to 10% of the CET1 capital of ING Bank. These exposures are subject to 250% risk weight.

A small part of the equity exposure of ING's portfolio is subject to the simple risk weight method for calculating the regulatory capital.

Credit RWA Migration Analysis

The table below explains the changes in Credit RWA in the AIRB portfolio during the reporting period and provides additional information by linking the impact of changes in portfolio composition, model changes and shifts in the risk environment on Credit RWA. The table reconciles movements in Credit RWA for the period for each Credit RWA risk type of ING for the AIRB portfolio including securitisations excluding equity and ONCOA. It does not include counterparty credit risk exposures under the Internal Model Method (IMM), as ING has not yet received regulatory approval to use IMM.

EU CR8 RWA flow statement of credit risk exposures under the IRB approach

	RWA amounts	2018 Capital requirements
RWAs at the end of the previous reporting period	198,339	15,867
Asset size	15,952	1,276
Asset quality	-11,693	-935
Model updates	5,192	415
Methodology and policy	1,743	139
Foreign exchange movements	2,169	173
Other	-287	-23
RWAs at the end of the reporting period	211,415	16,913

Including securitisations, equity, ONCOA and counterparty credit risk exposures.

Over the year 2018 the credit RWA in the IRB portfolio grew by EUR 12.9 billion to EUR 211.4 billion.

- **Asset size:** Growth in the asset size of the portfolio led to an increase of RWA by EUR 16.0 billion, mainly observed in the Wholesale Banking (EUR 10.8 billion RWA) and Challenger & Growth portfolios (EUR 4.3 billion RWA). The growth in the Challengers & Growth portfolios was observed mainly in the Germany and Poland. EUR 1.2 billion RWA of the increase in Germany was due to asset transfer from US Wholesale Banking to ING DiBA. The asset size of the Wholesale Banking portfolio grew in the General Lending and Structured Finance. EUR 3.1 billion RWA of the growth in Wholesale Banking was due to asset transfer from Turkey Retail Banking to Wholesale Banking. In the Market Leaders portfolio the asset size increased in BeLux while the growth in the Netherlands was stagnant.
- **Asset Quality:** The risk profile of the portfolio improved, resulting in a reduction of EUR 11.7 billion RWA. The largest decrease was related to improved risk profiles in Wholesale Banking (mainly General Lending and Structured Finance) and C&G countries (mainly in Germany, Poland and Spain) decreasing RWA by EUR 6.5 billion and EUR 2.5 billion, driven by improved economic conditions. NVM House Price index uplift also further improved the book quality of the Dutch mortgages portfolio by relieving RWA by EUR 2.1 billion RWA. Furthermore, country risk rating upgrades for Russia, Spain and United States of America decreased RWA by EUR 0.6 billion while Turkey country rating downgrade partly offset the trend by increasing RWA by EUR 1.1 billion.
- **Model Updates:** Project Finance and CPF LGD Model updates caused an RWA increase of EUR 3.4 billion and EUR 1.7 billion respectively. The CPF LGD Model updates is a reclassification from ONCOA. Luxemburg retail and SME PD model and Spanish mortgages PD and LGD model update and NL SBF provisioning calculation change further increased RWA by EUR 0.2 billion, EUR 0.1 billion and EUR 0.2 billion respectively. On the other hand, Belgium SBF and SME LGD model updates partly offset the RWA increase by decreasing RWA EUR 0.3 billion.
- **Methodology and policy:** During 2018, 30% Add-on on Belgium mortgages required by Belgian regulator increased RWA by EUR 1.6 billion while cash flow based maturity calculation methodology change partly compensate this increase by reducing RWA by EUR 0.9 billion. There were also model add-ons for dutch mortgages LGD Model related TRIM exercise and Project Finance NPL LGD Model increasing RWA by EUR 0.6 billion together. Exposure class change for various clients from Corporates SME to Corporas Other caused further RWA increase of EUR 0.3 billion. Besides, margin of conservatism adjustment for Luxembourg retail portfolio models added additional EUR 0.2 billion to the total RWA impact of Methodology and policy.
- **Foreign exchange movements:** The increase of RWA by EUR 2.2 billion can be allocated to appreciation of US dollar during 2018. US dollar appreciation against Euro (5.0%) caused an increase of RWA by EUR 2.8 billion whereas Australian dollar (-5.4%) and Polish zloty (-2.8%) depreciated against Euro and partly balanced the RWA increase by decreasing it by EUR 0.2 billion each.
- **Other:** The remaining decrease of EUR 0.3 billion RWA was mainly due to SIMBA securitisation program impacting RWA positively by EUR 0.6 billion. Furthermore, client and portfolio level cover updates and punitive rated clients which have lowered rating due to late rating assignment or unrated by business units affected RWA as well.

Overall, RWA management has a high priority throughout ING Group in all aspects of our business. From product design to pricing, RWA allocation and consumption is extensively monitored, reported and managed at all levels of the organisation.

Credit risk approach

This section is to be read in conjunction with the Risk Management paragraph of the Annual Report.

ING applies the Advanced Internal Ratings Based (AIRB) approach on the majority of its significant portfolios that contain credit risk in accordance with the required approvals granted by ECB and various local regulators. The AIRB approach is permitted by the regulator if there are regulatory approved rating models (PD, EAD and LGD) in place and if the (local) management understands and uses these rating models (Basel Use Test) in their credit decision-making processes. However, a small portion of the portfolio remains subject to the Standardised Approach (SA). The majority of SA portfolios at ING relate to subsidiaries where the home regulator does not have a robust AIRB framework or requirement.

Credit risk capital and measurement

Credit risk capital

Regulatory capital is the minimum amount of capital (based on 99.90% confidence level) that ING holds from a regulatory perspective as a cushion to be able to survive large unexpected losses.

RWA comparison

Comparison of RWA and risk weights across institutions is inherently challenging. Differences in RWA among banks have been classified by the BIS in 3 categories:

- Risk based drivers that stem from the differences in underlying risk at the exposure/portfolio level and in business models/strategies including asset class mix;
- Practice-based drivers including approaches to risk management and risk measurement; and
- Regulatory environment such as supervisory practices, implementing laws and regulations including national discretion and accounting standards.

Risk based drivers

ING's portfolio is dominated by secured lending especially in the areas of residential mortgages, leasing and commercial real estate. Secured lending tends to have a much lower LGD, given the collateral involved, which is a key driver of RWA calculations. Therefore the regulatory formula for residential mortgages tends to result in lower RWA, all other factors being equal.

Practice based drivers

ING has a proactive approach to non-performing exposures. Non-performing exposures are recognised early based on unlikely to pay triggers. For non-retail, ING typically classifies default based on a borrower rating and not a facility rating which means that a customer will only have one PD (probability of default) regardless of the type(s) of transactions done with ING. As a consequence, if one facility is in default, usually all facilities of the client are in default. Non-performing clients which were granted forbearance measures have an additional probation period of 1 year starting from the last moment they are classified as forborne, before returning to performing status.

Regulatory environment

ING's primary supervising entity is the ECB, which is supported by many host supervisors. The ECB supervises adherence to regulatory rules: the regulatory framework defined in CRR/CRD, European Bank Authority (EBA) standards and ECB guidance. The ECB requires all 'significant changes' in internal models (PD, LGD, EAD and IFRS 9) and policies to be reviewed and approved by the ECB, prior to implementation. Lower level model changes are either pre-notified or post-notified to the ECB.

Comparing capital levels across banks is a challenging exercise because of different risk profiles, differences in risk based drivers, practice based drivers and the regulatory environment (e.g. advanced internal rating based approach or the standardised approach). These factors have a substantial impact on the regulatory capital/RWA of a financial institution. ING continues to work with industry groups and strives to adhere to the latest BIS and EBA recommendations to improve the transparent reporting of the bank's capital calculations.

Economic capital

Economic capital reflects ING's own view on credit risk, which allows it to be used in decision-making processes at (sub) portfolio level. Credit risk and transfer risk capital are calculated for all portfolios which contain credit or transfer risk, including investment portfolios. Economic capital is the minimum amount of capital required to cover unexpected losses within a 99.95% confidence level and a 12 month time horizon. It is used throughout ING in the decision-making process (mainly wholesale banking), in risk adjusted counterparty and portfolio profitability measurement tools (wholesale and retail banking), in investment and divestment decisions, in the country risk framework and in concentration risk management, including risk appetite statements (RAS). Economic capital is calculated using the economic values of rating models (PD, EAD and LGD), in line with regulatory requirements.

An important characteristic of our IT systems and framework is that models are built for several purposes, including economic capital, regulatory capital and loan loss provisioning. These credit risk models are used throughout the organisation which is compliant with the Basel Use Test requirement and facilitates active feedback on the risk parameters by business units.

Credit risk measurement

There are two ways to measure credit risk for regulatory reporting purposes within ING's portfolio, depending on whether the exposure is booked under an ING office which is permitted by the ECB to use the advanced internal rating based (AIRB) approach, or if it falls under the standardised approach (SA).

Standardised approach

The SA applies a fixed risk weight to each asset as dictated by the CRR, and is based on the exposure class to which the exposure is assigned. As such, the SA is the least sophisticated of the regulatory capital methodologies and is not as sensitive as the risk-based approach. Where external rating agency ratings are available, they may be used as a substitute to using the fixed risk weightings assigned by the Financial Supervisory Authorities. Because the underlying obligors are relatively small for exposures treated under SA, the underlying obligors tend not to have external ratings.

Advanced internal rating based approach

There are five main elements that drive the determination of risk-weighted assets under the AIRB approach.

- **Probability of Default (PD):** The first is the borrower's probability of default, which measures a client's creditworthiness in terms of likelihood to go into default. It attempts to measure the senior, unsecured standalone creditworthiness of an organisation without consideration of structural elements of the underlying transactions, such as collateral, pricing, or maturity. Each borrower has a rating which translates into a specific PD.
- **Exposure at Default (EAD):** The second element is the borrower's exposure at default. EAD models are intended to estimate the outstanding amount or obligation at the moment of default. Since the time in which a client may go into default is unknown, and the level of outstandings that may occur on that date is also unknown, ING uses a combination of statistical and hybrid models to estimate the EAD. With the exception of guarantees and letters of credit, the EAD is always equal to or higher than the associated credit risk outstandings, under the assumption that clients tend to absorb liquidity from available credit resources before financial problems become apparent to the client's creditors. EAD is largely a function of the type of credit facility (overdraft, revolving, term) offered to the borrower.
- **Loss Given Default (LGD):** The third element is loss given default. LGD models are intended to estimate the amount ING would lose after liquidating collateral pledged in association with a given loan or financial obligation, or alternatively, from liquidating the company as a whole as part of a workout process. LGD models are based on cover types, estimated recovery rates given orderly liquidation, and (in)direct cost of liquidation.
- **Maturity (M):** The fourth element is the time to the maturity of the underlying financial obligation. Regulatory requirements (CRR/CRDIV) floor the maturity element at one year and cap it at five years.
- **Exposure Class:** The fifth element is the exposure class (a regulatory prescribed grouping of a common obligor type or product type) which is a driver for the correlation factor. To calculate risk-weighted assets the default correlation between a transaction and all other transactions in the portfolio is taken into account.

The expected loss (EL) provides a measure of the value of the credit losses that ING may reasonably expect to incur on its portfolio. In its basic form, the expected loss can be represented as:

$$EL = PD * EAD * LGD$$

Securitisations

ING has implemented the AIRB approach for credit risk. As a consequence, ING uses the rating based approach (RBA) for investments in tranches of asset-backed securities (ABS) and mortgage-backed securities (MBS) which have been rated by external rating agencies. Rating agencies which are used by ING under the RBA include Standard & Poor's, Fitch and Moody's.

Under the RBA, the RWA are determined by multiplying the amount of the exposure by the appropriate regulatory risk weights, which depend on:

- The external rating or an available inferred rating;
- The seniority of the position; and
- The granularity of the position.

Further, CRR/CRD IV introduced an additional regulatory capital charge for material increases in the Credit Valuation Adjustment (CVA), the market price of the counterparty credit risk of derivatives. In particular, as credit spreads of ING's counterparties increase, CVA will increase as well and ING will incur a loss. ING follows the SA for calculation of the capital charge to cover CVA Risk (CVA capital) in accordance with the CRR/CRD IV. The scope of the products and counterparties that the CVA capital charge is applied to also follows those regulations.

ING uses the AIRB and the Internal Assessment Approach (IAA) for liquidity lines provided to Asset Backed Commercial Paper programmes and this is explained in more detail in the securitisation section. ING does not use the Basel Foundation IRB Approach (FIRB) for any of its portfolios.

Credit risk tools

Exposure classes

The BCBS has developed the concept of 'Exposure Classes' which has been transposed into CRR/CRDIV. These are essentially groupings of credit risks associated with a common client type, product type and/or cover type. For the AIRB Approach, most of the exposure classes have subcategories. ING has applied the following definitions to determine Exposure Classes:

- Sovereigns include Sovereign Government entities, Central Banks and recognised Local / Regional Authorities as well as Supranational Organisations;
- Institutions include Commercial Banks, non-Bank Financial Institutions, such as Funds and Fund Managers, and Insurance Companies, as well as local and regional government entities not classified as governments;
- Corporates includes all legal entities, that are not considered to be Governments, Institutions or Retail Other;
- Retail includes the following classes:
 - Retail - Secured by immovable property non-SME (hereafter residential mortgages) includes all retail loans which are covered by residential properties;
 - Retail - Secured by immovable property SME (included in tables with Other Retail) includes all retail loans which are covered by commercial properties; and
- Other Retail includes all other credit obligations related to Retail SMEs (such as partnerships and one-man businesses) and private individuals (such as consumer loans, car loans and credit cards). Under these exposure class definitions, it is possible for a private individual to have exposure classified as both residential mortgages and retail other.
- Securitisations include securitisation programs for which ING acts as an investor, sponsor or originator.

Models used for exposure classes

ING has developed PD, EAD and LGD models for Wholesale Banking and Retail Banking portfolios. These models are subject to CTRC approval and changes which significantly impact the results require approval from the regulator before implementation. By nature, the above described exposure classes have different, specific characteristics. To capture these specific characteristics and to have suitable valuations and analyses in place, Model Development is continuously updating and developing models within each exposure class.

ING master scale

Internal rating grade and corresponding PD and external rating equivalent			
Internal rating grade		PD range for each grade	External Rating Equivalent
Performing

Non-performing			
	20	100%	Default
Non-performing grade	21	100%	Default
	22	100%	Default

AIRB models per exposure class

In the table below, the number of significant PD, EAD and LGD models per asset class are shown. Additionally a description of the model and methodology are provided per exposure class. The asset classes presented in this table do not align with the EBA Exposure classes as the scope has been redefined to better fit the scope of the model. SME exposure, for example, can be part of either corporate exposures or other retail depending on the size of the SME.

AIRB models and methodology				
	Model Type	Number of significant models	Model description and methodology	Number of years of data
Sovereigns	PD	1	The Government Central PD model is a fully statistical model, containing only quantitative risk drivers.	>7 years
	LGD	1	The LGD model for Sovereigns and other governments is an unsecured recovery model built on assessment of structural factors that influence a country's performance.	>7 years
	EAD	1	The Low Default EAD model is a hybrid model that pools default information from multiple low default portfolios, including central governments and central banks.	>7 years
Government related entities	PD	1	The government related entities PD model is expert based and assigns ratings based on stand-alone credit fundamentals as well as degree of government support.	>7 years
	LGD	1	The LGD model for Government related entities is a secured/unsecured recovery model built on assessment of stand-alone fundamentals as well as geography.	>7 years
	EAD	1	The Low Default EAD model is a hybrid model that pools default information from multiple low default portfolios, including government related entities.	>7 years
Financial institutions	PD	3	The main PD model applied is Bank Commercial based upon financial, qualitative and country information. Other PD models for different types of financial institutions are built using a similar framework, but are more specialised for the specific characteristics of the financial institution.	>7 years
	LGD	1	This LGD model was developed based on expert judgement, supported by limited internal and external data. The developed LGD model is based on ultimate recovery rates.	>7 years
	EAD	1	The Low Default EAD model is a hybrid model used that pools default information from multiple low default portfolios, including financial institutions.	>7 years
Corporates - Specialized lending	PD	3	Expert based scorecards Models predict a rating for Commercial Property Finance, Project Finance, Trade and Commodity Finance.	>7 years
	LGD	3	Hybrid LGD Models predict loss given default for Commercial Property Finance, Project Finance, Trade and Commodity Finance.	>7 years
	EAD	1	There is a dedicated EAD model for commercial property finance due to the specificities of this portfolio.	>7 years
Large Corporates	PD	1	The Corporate Large model is a global hybrid model build on 13 years of data, including balance sheet and qualitative information as well as country risk and parent influence.	>7 years
	LGD	1	Loss Given Default for Large corporates are predicted by a dedicated hybrid LGD model using both no loss rates as well as secured/unsecured recovery rates.	>7 years
	EAD	1	The Low Default EAD model is a hybrid model used that pools default information from multiple low default portfolios, including large corporates.	>7 years
SME	PD	6	The SME PD models are estimated statistically and directly predict a PD. Most of these models are developed locally to reflect regional/jurisdiction circumstances.	>7 years
	LGD	6	Local statistical models or hybrid models use various data inputs on cure behaviour as well as cost and recovery.	>7 years
	EAD	6	Local statistical models that use various data inputs, including product type and geography.	>7 years
Secured by residential mortgages	PD	7 ¹	The PD mortgages models are all developed statistically and include borrower specific information, payment behaviour and product related information. These are statistical models that directly predict a PD.	>5 years ²
	LGD	7	Local statistical models or hybrid models use various data inputs on cure behaviour as well as cost and recovery	>7 years
	EAD	7	Local statistical models that use various data inputs, including product type and geography.	>7 years

Private Individuals	PD	4 ¹	The PD models for private individuals are all developed statistically and include borrower specific information, payment behaviour and product related information. These are statistical models that directly predict a PD.	>5 years ²
	LGD	4	Local statistical models use various data inputs on cure behaviour as well as cost and recovery.	>7 years
	EAD	4	Local statistical models that use various data inputs, including product type and geography.	>7 years
Other ¹	Other		(Covered Bonds, Structured assets)	

¹ Belgian PD models provide a rating at a customer level, covering both secured and unsecured loans.

² For retail PD modelling a minimum of 5 years is allowed based on ING's Modelling Standards, which are compliant with regulatory requirements.

Credit risk exposure excluding Counterparty Credit Risk

In this credit risk section the tables shown represent the net values of on- and off-balance sheet exposures as per EBA definitions. The scope of these tables are the credit risk exposures excluding the counterparty credit risk exposures (within the Risk Management paragraph these are named Pre-Settlement exposures), Securitisations, Equity positions, CVA RWA, default fund contribution (DFC) and ONCOA items. As per 2017 the DFC is excluded from the credit risk tables as this is strongly related to the Pre-settlement portfolio and therefore reported in the pre-settlement tables in the Counterparty Credit risk section.

In the next four tables the net carrying values are broken down per exposure class, geography, counterparty type and maturity.

The table below displays the net carrying values at the end of 2017 and as per end of 2018 per AIRB and SA exposure classes. Next to it the average net carrying value per the same exposure classes over the past 4 quarters is provided. This average net carrying value is based upon the last 4 quarter-end observations in the year 2018.

EU CRB-B: Total and average net amount of exposures

	Net carrying value ¹ of exposures at the end of 2018	Average net exposures over the period	Net carrying value of exposures at the end of 2017
AIRB Approach			
Central governments or central banks	268,349	253,181	231,353
Institutions	108,054	108,143	102,315
Corporates	450,708	434,664	412,761
Of Which: Specialised lending	159,650	155,004	144,998
Of Which: SME	27,610	33,332	35,634
Retail	330,343	329,579	325,702
Secured by real estate property	299,959	299,006	295,503
SMEs	11,805	11,859	11,630
Non-SMEs	288,154	287,147	283,873
Other Retail	30,384	30,573	30,199
SMEs	5,029	5,316	5,381
Non-SMEs	25,355	25,257	24,818
Total AIRB approach	1,157,454	1,125,567	1,072,131
SA approach			
Central governments or central banks	3,484	3,508	3,830
Regional governments or local authorities	220	210	246
Institutions	1,940	2,471	4,110
Corporates	10,489	11,186	12,392
of which: SMEs	1,854	2,412	2,853
Retail	17,366	17,010	16,436
of which: SMEs	3,862	4,238	4,623
Secured by mortgages on immovable property	18,086	18,036	18,147
of which: SMEs	1,553	2,167	2,809
Exposures in default	540	492	471
Total SA approach	52,125	52,912	55,632
Total	1,209,579	1,178,479	1,127,763

¹ The net carrying values correspond to the original exposure (on and off-balance) pre-credit conversion factors corrected for allowances, impairments and provisions.

In 2018, the total net carrying value of the AIRB portfolio increased by EUR 81.8 billion. The growth in the central governments or central banks' exposure class relates to regulatory reserve deposits, fixed rate notes and issuer investments limits, and the growth in the Corporates exposure class was observed in term loans, revolvers and Letter of credits and guarantees.

The SA portfolio decreased EUR 3.5 billion in 2018, mainly caused by decreased nostro balances at institutions and trade related transactions, term loans and performance bonds in corporates.

Exposure by geography

The table below presents a breakdown of net carrying value of exposures and their totals by geographical area and exposure classes under the AIRB and SA approaches.

EU CRB-C: Geographical breakdown of exposures

2018	Net carrying value ¹									
	Europe	Netherlands	Belgium & Luxembourg	Germany	Other Europe	America	Africa	Asia	Australia	Total
Central governments or central banks	229,860	49,578	52,429	71,672	56,182	19,202	599	10,464	8,225	268,349

Total SA approach	52,141	7,773	1,300	352	42,715	43	5	479	2,964	55,632
Total	879,216	255,814	174,140	172,487	276,774	90,657	5,884	99,227	52,779	1,127,763

1 The net carrying values correspond to the original exposure (on and off-balance) pre-credit conversion factors corrected for allowances, impairments and provisions.

During 2018, net carrying value increased by EUR 53.9 billion in Europe. One of the main drivers of this growth is an increase in exposure (money market and regulatory) due to deposits given to De Nederlandsche Bank and Deutsche Bundesbank

Second, there was growth in Belgium & Luxembourg, Netherlands, Germany and Switzerland mainly in term loans and revolvers in the corporates exposure class. Further in Asia, trade related transactions in Singapore and Hong Kong and revolvers in Japan and China were the main driver for increased exposures in the corporates exposure class.

Exposure by industry or counterparty type

The following table provides a breakdown of the net carrying values by industry or counterparty type per exposure class, for both the AIRB and SA portfolio and ordered by the size of the combined AIRB and SA exposure. These industry sector or counterparty types are based upon the European NACE² codes (Nomenclature statistique des Activités économiques dans la Communauté Européenne) and reflect the main activity of the client. The industry or counterparty type allocation is based exclusively on the nature of the client. The classification of the exposures incurred jointly by more than one obligor should be done on the basis of characteristics of the obligor that was the more relevant, or determinant, for the institution to grant the exposure.

EU CRB-D: Concentration of exposures by industry or counterparty types							
	Net carrying value ¹						
	Activities of households as employers and own use	Wholesale and retail trade	Financial and insurance activities	Public administration and defence, compulsory social security	Manufacturing	Other Services	Total
2018							
Central governments or central banks			109,157	155,663	2	3,527	268,349
Institutions			95,950	7,481	24	4,600	108,054
Corporates	52	92,591	485,847	0	95,002	217,216	450,708

Regional governments or local authorities				168		52	220
Institutions			1,923			17	1,940
Corporates	346	2,949	247		4,252	2,695	10,489
Retail	8,613	1,869	362	991	1,590	3,941	17,366
Secured by mortgages on immovable property	10,871	712	54	8	867	5,575	18,086
Exposures in default	231	105	3	3	68	130	540
Total SA approach	20,061	5,634	5,310	1,934	6,776	12,411	52,125
Total	292,472	104,483	258,156	178,511	110,788	265,170	1,209,579

1 The net carrying values correspond to the original exposure (on and off-balance) pre-credit conversion factors corrected for allowances, impairments and provisions.

² NACE is the regulatory requirement for this table. At ING in general the NAICS industry codes are used, for example in the Risk Industry Concentration section in the Risk Management Paragraph.

EU CRB-D: Concentration of exposures by industry or counterparty types

	Net carrying value ¹						
	Activities of households as employers and own use	Wholesale and retail trade	Financial and insurance activities	Public administration and defence, compulsory social security	Manufacturing	Other Services	Total
2017							
Central governments or central banks			81,481	146,373		3,499	231,353
Institutions			90,618	7,290	48	4,359	102,315
Corporates		82,175	46,069	9	89,862	194,593	412,761
Retail	270,324	5,796	1,716	13,344	9,008	25,514	325,702
Total AIRB approach	270,378	87,971	219,884	167,016	98,917	227,965	1,072,131
Central governments or central banks			2,729	1,100		1	3,830
Regional governments or local authorities				213		33	246
Institutions			4,110				4,110
Corporates	283	3,588	396		4,635	3,490	12,392
Retail	7,268	2,230	316	864	1,899	3,859	16,436
Secured by mortgages on immovable property	9,524	1,195	75	12	1,316	6,024	18,147
Exposures in default	224	81	3	3	64	96	471
Total SA approach	17,300	7,094	7,629	2,192	7,913	13,504	55,632
Total	287,677	95,065	227,513	169,208	106,831	241,469	1,127,763

1 The net carrying values correspond to the original exposure (on and off-balance) pre-credit conversion factors corrected for allowances, impairments and provisions.

The table shows the industry or counterparty types that represent at least 5% of the total net carrying value. In total the top 5 counterparty or industry types makes up 78% of the exposure in 2018. The other counterparty or industry types exposures are grouped under the Other Services. Manufacturing is logically mostly found in the corporate exposure class and the Financing activities in the Institutions and Sovereign exposure classes.

The exposure in Financial and insurance activities increased due to (regulatory reserve) deposits in Europe and issuer investment limit balances in Asia.

The increase in the Manufacturing industry was related to term loans and revolvers in Europe, term loans in America and trade related transactions in Asia. The increase in Public administration and defence, compulsory social security sector exposure mostly consisted of government bonds of United States and European countries; namely Poland, Czech Republic and Germany, Brazil and local governments in Canada. Wholesale and retail trade exposures contained letter of credits, revolvers, overdrafts and term loans in mainly Singapore, Switzerland, Netherlands, Hong Kong and United Arab Emirates. In other services, biggest exposure increase was observed within Mining and Quarrying, Information and Communication, Real Estate Activities and Transportation and Storage industries.

Within the SA portfolio, exposure decrease was due to nostro balance drop at Institutions in Europe. Besides, residential mortgages exposures increased significantly in Poland and Romania whereas term loans for households increased in France, Poland, Romania and Italy.

Exposure by maturity

The table below presents a breakdown of the net carrying value by residual maturity, for both AIRB and SA exposure classes. In ING's data model all transactions get assigned a regulatory maturity between 1 day and 5 years.

EU CRB-E: Maturity of exposures

2018	Net carrying value ¹			Total
	<= 1 year	> 1 year < 5 years	>= 5 years	
Central governments or central banks	115,548	86,464	66,337	268,349
Institutions	65,382	27,811	14,860	108,054
Corporates	173,800	192,990	83,918	450,708
Retail	10,685	27,102	292,556	330,343
Total AIRB approach	365,415	334,367	457,672	1,157,454

Corporates	4,994	5,786	1,612	12,392
Retail	4,925	6,975	4,535	16,436
Secured by mortgages on immovable property	2,375	3,936	11,836	18,147
Exposures in default	262	31	178	471
Total SA approach	19,284	17,893	18,455	55,632
Total	353,721	310,658	463,384	1,127,763

1 The net carrying values correspond to the original exposure (on and off-balance) pre-credit conversion factors corrected for allowances, impairments and provisions.

The largest part of the exposure is in the > 5 years maturity bucket (39.5%). This bucket comprises residential mortgages, which typically have longer maturities. The lower maturity buckets for Central Governments or Central Banks are mostly in money market deposits and regulatory reserve deposits and revolving loans. Exposures in the other two buckets are predominantly seen in bond investment products. Regarding Corporates, revolving loans, guarantees and letters of credit make up the majority of the exposure seen in the first maturity bucket, whereas term loans and revolving loans are the dominant product types in the longer maturity buckets.

For the SA portfolio, most exposures within corporate exposure classes can be found in the first two maturity buckets. Due to residential mortgages, most exposures are with the third bucket.

In the AIRB portfolio, the exposure increased mainly in the Central Governments or central banks' exposure class, related to (regulatory reserve and money market) deposits in the first two buckets. The exposure increase in Corporate was significant in the first two bucket due to term loans and revolvers. The retail portfolio exposure increased in the > 5 years bucket indicates the growth in residential mortgages and term loans. In the SA portfolio, retail and secured by mortgages on immovable properties categories exposure increased in longest maturity bucket while exposure decreased for the shorter buckets which was significant in term loans in retail and residential mortgages in secured by mortgages on immovable properties exposure class.

Advanced Internal Rating Based approach (AIRB)

The AIRB approach has five main elements that drive the CRR/CRD IV 'risk-based approach' for the determination of RWA and EL. The elements include: Exposure Class, Probability of Default (PD), Regulatory Exposure at Default (READ), Loss Given Default (LGD) and maturity (M). For further details on these elements please see the 'Risk Management' part of the consolidated annual accounts.

AIRB credit exposures by exposure class and PD range

The table below provides an overview of the main parameters used for the calculation of capital requirements for AIRB models. The on-and off-balance sheet exposures are shown by the four main exposure classes and according to PD grades to enable an assessment of the credit quality of the portfolio. The exposures are bucketed in PD Scales prescribed by EBA. This bucketing of PD scales is not used within ING. The ING's Probability of Default (PD) rating models are based on a 1-22 scale, which corresponds to the same rating grades that are assigned by external rating agencies. Risk Ratings (PD) for performing loans (1-19) are calculated within ING with regulatory approved models. Risk Ratings for non-performing loans (20-22) are set on the basis of an approved discretionary methodology by the Global or Regional Restructuring unit. Overall the risk weights of the ING portfolio are a mixture of low risk weights for sovereigns and residential mortgages combined with higher risk weights for Corporates. Many central governments exposures receive a zero risk weight due to the high quality rating (permanent partial use of the SA rules). Mortgages generally benefit from large levels of (over) collateralisation.

The average Credit Conversion Factor CCF (the conversion of off-balance sheet exposure into credit exposure equivalents) is calculated as the off-balance exposure post-crm and post-ccf over the original off-balance sheet exposure. The CCF's percentages are applied on product or transaction level and are regulatory driven.

All figures are in millions of EUR, except for the number of obligors. All cells that are left blank have minimal values.

The PD, LGD, EAD and maturity are drivers of RWA and RWA density. RWA density is measured as the RWA over the EAD and increases with each PD scale. In several instances the RWA Density is lower than one might expect, due to the loans guaranteed by an Export Credit Agency (ECA). These ECAs offer loans and insurance to help remove the risk of uncertainty of exporting to other countries and underwrite the political risk and commercial risks of overseas investments, and as such lower the LGD for these loans. With very low LGDs as a result the RWA is lower than would be assumed in a higher PD class.

The Central Governments and Central Banks exposures mostly consists of bond investments issued by European sovereigns. The majority of the exposure resides in the 0.00 – 0.15 PD scale and the RWA density of this bucket remained stable at 4%. The defaulted exposures in central governments and central banks exposures belonged to a few African sovereigns.

RWA increased by EUR 13.1 billion in 2018 mainly due to Corporate exposures class. The increase of RWA in the Corporates exposures class was spread to all the buckets except for default bucket category. Default bucket RWA decreased due to risk profile improvements and repayments. Regarding the retail exposure class, the PD buckets 0.15 to < 0.25 and 0.75 to < 2.50 PD drove the increase in the RWA.

Note: The reported figures for 2017 have been adjusted compared to the Pillar III Report 2017 following an adjustment in the calculation methodology.

Over the year, PD's for most geographical areas and sectors improved, in line with the prevailing economic environment. For the calculation of the average LGD, ING adjusted the calculation resulting in slightly higher LGD's for most of the locations and sectors than it was reported in previous year.

Backtesting of model parameters

ING has dedicated AIRB credit risk models per business line and geography. The performance and predictive power of the models is monitored by Model Development, that is part of the Financial Risk department. Moreover an independent Model Risk Management department periodically reviews all AIRB models. All models are backtested when possible by both the Model development and the independent Model Risk Management departments.

If a model is considered not to be robust or backtesting indicates insufficient performance, then the model is either re-calibrated or re-developed. All model recommendations from the Model Risk Management department are tracked via an internal database that management uses to track issues detected by the Internal Audit department, incidents and non-financial risk issues. All significant model changes are submitted to the ECB and implemented after regulatory approval. On average, 81% of the AIRB credit risk models in the validation cycle have had 'No to Remote' (44%) and 'Minor' (37%) model deficiencies.

PD backtesting

The PD backtesting is performed per exposure class and PD-range, corresponding to the internal rating scales 1 to 19, which are then mapped to comparable rating grades from Standard & Poor's. Securitisations and Equity exposures are not included in these tables.

The average PD as of 31 December 2018 per portfolio is split per exposure class and rating grade. Both the number and the amount-weighted predicted PD figures are shown for the performing portfolios. The number weighted predicted PD is also referred to as the arithmetic weighted PD, and the amount weighted PD is referred to as the EAD-weighted PD.

The Annual Average historical default rate is calculated over the last 6 years, from 2013 until 2018. The performing clients at the end of each year were followed through the following year (12 months) and their into-default moments were flagged each month. In case a client went into-default more than once within the 12-month observation period, the last (i.e. most recent) observed into-default moment was used. The annual average observed default rate represents the average of the 6 years observed number weighted default rates.

It should be noted that some of the observed values related to low number of observations (in particular for Sovereigns), hence the numbers should be interpreted with care. For some of the ratings, in particular for the Corporate exposures class, some of the observed values fall above the range of estimation. Until the models have been redeveloped and approved in the context of incorporating new regulations, this has been compensated by add-ons or other prudential measures. Overall, the EL backtest (see EU CR9) does not exhibit underestimations.

EL backtesting

The table below gives insight in the Expected Loss rate and the Observed Loss rate. The expected loss as of 31 December 2017 for the performing portfolio is split per exposure class. The 31 December 2017 portfolio is followed through 2018 to determine the defaulted exposures. The models are based on long series of historical data. In the comparison, the expected loss rate is calculated by dividing the expected loss of the performing portfolio as of 31 December 2017 by the READ of the performing portfolio of the same period. The Observed Loss rate is a result of multiplying the observed defaulted exposures by its EAD. This backtest is only representative of the year end 2018 portfolio and can be influenced by small sample sizes or incidents. Nonetheless, backtesting gives a comparison of the Expected Loss rate versus the observed Loss rate.

Expected loss rate under the Advanced IRB approach versus the observed loss rate per exposure class					
2018	Sovereigns	Institutions	Corporate	Other retail	Total
Expected loss rate 2017*	0.01%	0.05%	0.27%	0.21%	0.20%
Observed Loss Rate 2018	0.00%	0.01%	0.68%	0.41%	0.42%

Includes the AIRB portfolio only; excludes securitisations, equities and ONCOA.

* Expected loss rate 2017 includes performing loans only.

Standardised Approach

A subset of the ING portfolio is treated with the Standardised Approach (SA approach). The SA approach applies fixed risk weights to each exposure class, split into credit quality steps (based on external ratings) as dictated by the Capital Requirement Directive (CRD). The SA approach is the least sophisticated of the CRR/CRD IV methodologies and is not as risk sensitive as the risk-based AIRB Approach.

In order to calculate the regulatory capital requirements under the SA approach, ING uses eligible external ratings from Standard & Poor's, Moody's and Fitch Ratings. Ratings are applied to all relevant exposure classes in the SA approach. For the mortgage portfolio, fixed risk weights (based on the LtV) are used.

Exposures before and after risk mitigation for the SA portfolio

The table below shows how credit risk mitigation (CRM) in the SA portfolio is distributed over the exposure classes. ING's exposure value is shown before and after credit risk mitigation. There are three principal methods for reducing or mitigating Credit Risk: i) by reduction of credit risk through the acceptance of pledged financial assets as collateral or mitigation or shifting of credit risks to a lower risk weighting group, ii) by accepting guarantees from unrelated third parties, or iii) secure by mortgages. ING uses both methods to take CRM effects into account. For financial markets collateral, ING uses the Financial Collateral Comprehensive Method to allow for mitigation effects.

The table below illustrates the effect of all CRM techniques applied in accordance with the Part Three, Title II, Chapter 4 of Regulation (EU) 575/2013 on the standardised approach capital requirements' calculations.

EU CR4: Standardised approach - credit risk exposure and Credit Risk Mitigation (CRM) effects						
2018	Exposures before CCF and CRM		Exposures post-CCF and CRM		RWA and RWA density	
	On-Balance Sheet amount	Off-Balance Sheet amount	On-Balance Sheet amount	Off-Balance Sheet amount	RWA	RWA density
Exposure classes						
Central governments or central banks	1,519	1,975	1,586	18	1,444	90%

Total	39,429	16,897	38,657	3,188	26,122	62%

Excludes Counterparty Credit Risk exposures.

The largest SA portfolios are in Poland, Turkey, Romania, Spain, Australia, Italy and Belgium. The total SA exposure before CCF and CRM decreased by EUR 3.3 billion or 5.8% compared to December 2017.

Risk weights per exposure class

The table below presents the breakdown, post conversion factor and post risk mitigation techniques, of exposures under the Standardised approach by exposure class and risk weight (corresponding to the riskiness attributed to the exposure according to SA approach). The risk weights presented encompass all those assigned to each credit quality step in Article 113 to Article 134 in Part Three, Title II, Chapter 2 of Regulation (EU) 575/2013.

EU CR5: Standardised approach Post-CCF and Post-CRM Techniques

Total	212	4,741	8,027	6,341	10,827	11,501	194	41,845

Excludes Counterparty Credit Risk exposures.

The exposure of the SA portfolio shrank by 4.1% to EUR 40.1 billion in terms of READ. In Central governments and central banks, the READ increase in 100% bucket was due to Turkey's external rating downgrade prior to which some portion of the exposure was within 50% in 2017. Other reason for READ decrease in 50% bucket in this exposure class was repayments. In institutions, the READ decrease within 20% bucket occurred in the Netherlands in 2018. Secured by mortgages on Real immovable property exposure class with 35% and 100% buckets are mostly Polish and Romanian residential mortgages and 50% bucket belongs to Australian residential mortgages

Credit quality

This section focusses on non-performing loans, which are loans where there is a reasonable probability that ING may encounter a loss, unless ING intervenes with specific and significant actions. In other words, in this category an account or portfolio requires a more intensified approach, which may include renegotiation of terms and conditions and/or business/financial restructuring. This section should be read in conjunction with the Risk Management paragraph sections of the Annual Report on: Risk Appetite Framework and Credit Quality.

The credit quality of risk exposures is presented in three tables providing insight in the credit quality per exposure class, industry or counterparty type and geography. These tables present the gross carrying values, consisting of on- and off-balance sheet exposures, split over non-performing / performing, specific risk adjustments and impairments/allowances. The net carrying values are the result of specific risk adjustments and / or after impairments/allowances and are presented at the end of the tables. These three tables should be read in conjunction with table EU CR6: IRB-Credit risk exposures by exposure class and PD range.

On-balance sheet items include loans and debt securities. Off-balance sheet items include guarantees given and irrevocable loan commitments. Pre-settlement exposures are not included in this section.

More information on the definition of non-performing loans and allowances can be found in the credit quality section of the Risk Management paragraph of the Annual report.

Credit quality of exposures

This section provides a comprehensive picture of the credit quality of the banks' assets per exposure class.

1 Includes 104 million for contingent liabilities

2 The net carrying values correspond to the original exposure (on and off-balance) pre-credit conversion factors corrected for allowances, impairments and provisions.

The defaulted exposures in the AIRB portfolio decreased by EUR 1.8 billion in 2018. The decrease is mostly spread amongst the corporate and retail portfolio. In the corporates portfolio, the decrease was mainly driven by repayments and positive risk migration in the Netherlands retail and Netherlands WB.

As per 1st of January 2018, the provisions are reported under IFRS 9 and not comparable with previous years under IAS 39. However, the provisions were stable over 2018 compared to the previous year.

During 2018, the increase in the defaulted exposures and provisions emanated from the SA portfolio. While defaulted exposure increase was relatively significant in Turkey, Italy, Netherlands and Belgium, provisions increase was significant in Romania and Spain under SA portfolio.

Total	13,106	1,119,347	-4,690	1,127,763

Excludes Counterparty Credit Risk exposures, Securitisations, CVA RWA, Equities and ONCOA.

1 Includes EUR 104 million for contingent liabilities

2 The net carrying values correspond to the original exposure (on and off-balance) pre-credit conversion factors corrected for allowances, impairments and provisions.

The defaulted exposures decreased within almost all industries. The biggest decrease were observed in Mining and Quarrying, Households and Real Estate Activities. Mining and quarrying industry showed a recovery in 2018 which was mostly witnessed in Netherlands WB and Belgium & Luxembourg WB while biggest improvement in Households was in Dutch residential mortgages due to good economic outlook.

2017										
Debt Securities	82,192		4	4	-1		-4			
Loans and advances	624,307	1,135	5,693	11,982	5,743	-725	-58	-3,794	-1,372	6,377 8,156
Off-balance sheet exposures	220,673		311	744	163			-101		249

1 This relates to the Collaterals and financial guarantees received for the total portfolio of forborne exposures

While the portfolio of ING grew in 2018, non-performing exposures and forborne exposures decreased. This is in line with the improved performance of the portfolio. An exception is the increased exposure in the ageing bucket performing but past due > 30 days and <=90 days exposures. This deterioration is a result of a changed delivery methodology following the implementation of the IFRS 9 and was mainly seen in the 31-60 days bucket and the 61-90 days bucket.

The total ING Bank forborne assets decreased by EUR1.5 billion to EUR 10.4 billion per December 2018. This was due to the decrease in the non-performing forborne assets of EUR 1.7 billion and the small increase in the performing forborne assets of EUR 0.2 billion. Almost 94% of the total forborne assets decrease was visible industries Real Estate EUR 0.5 billion, Natural Resources 0.5 billion which was mostly due to the Oil & Gas portfolio and Private Individuals EUR 0.4 billion. The main concentration of forborne assets in a single country was in the Netherlands with EUR 3.6 billion of total forborne assets.

Ageing of past due exposures

The table below gives an insight into the ageing of the FINREP eligible Business and Consumer exposures, including both performing and non-performing assets. The table covers Loans and Debt Securities. The values displayed are the on balance sheet gross carrying values before impairment, provisions before write-offs, as write-offs take place after the provisioning process.

EU CR1-D: Ageing of past-due exposures

2018	<= 30 days	>30 days <60 days	> 60 days <90 days	>90 days <180 days	>180 days < 1year	> 1year
Loans	652,113	1,401	503	1,574	811	3,246
Debt Securities	71,184					
Total exposures	723,297	1,401	503	1,574	811	3,246

EU CR1-D: Ageing of past-due exposures

2017	<= 30 days	>30 days <60 days	> 60 days <90 days	>90 days <180 days	>180 days < 1year	> 1year
Loans	609,209	941	2,822	1,151	939	6,743
Debt Securities	82,192					
Total exposures	691,401	941	2,822	1,151	939	6,743

The > 30 days past due reduced significantly over the year, from 1.79% as at 31-12-2017 to 1.03% as at 31-12-2018. Specifically, reductions were seen in the 30 to 90 days and the over 1 year past due buckets. Of the ≤ 30 days past due, 99% is 0 days past due.

Changes in the stock of general and specific credit risk adjustments

This table identifies the changes in the stock of general and specific credit risk adjustments held against loans and debt that are defaulted or impaired. General and specific credit risk adjustments: Include amounts defined in Article 1 of the Commission Delegated Regulation (EU) No 183/2014 of 20 December 2013. December 2018 is the first time this table is included in the Pillar 3 disclosure.

EU CR2-A: Changes in the stock of general and specific credit risk adjustments

2018

	Accumulated specific credit risk adjustment	Accumulated general credit risk adjustment
Opening balance	4,030	1,393
Increases due to amounts set aside for estimated loan losses during the period	312	230
Decreases due to amounts reversed for estimated loan losses during the period	-372	-301
Decreases due to amounts taken against accumulated credit risk adjustments	-991	
Transfers between credit risk adjustments	628	159
Impact of exchange rate differences	-386	-55
Business combinations, including acquisitions and disposals of subsidiaries		
Other adjustments		
Closing balance	3,221	1,426
Recoveries on credit risk adjustments recorded directly to the statement of profit or loss		
Specific credit risk adjustments directly recorded to the statement of profit or loss		

Changes in the stock of defaulted and impaired loans and debt securities

In the next table the changes of the stock of defaulted loans and debt securities is shown. The table shows the movements in the gross carrying amounts of the defaulted exposures. The line other changes includes primarily changes in volumes of defaulted loans for instance as a consequence of partial repayments, or FX impact.

EU CR2-B: Changes in the stock of defaulted and impaired loans and debt securities

2018

	Gross carrying value defaulted exposures
Opening balance	11,679
Loans and debt securities that have defaulted or impaired since the last reporting period	2,514
Returned to non-defaulted status	-1,330
Amounts written off	-1,044
Other changes	-1,270
Closing balance	10,548

LTV residential mortgages per country

The table below shows the weighted average Loan-to-Value (LTV) ratio of the ING residential mortgage portfolio per country. All LTV figures are based on market values. In most portfolios, ING uses official house price indices to adjust the market values. In several markets, customers provide additional collateral or (government sponsored) mortgage insurance programmes are used. None of these additional covers are included in the LTV figures.

Loan-to-Value residential mortgages per country

	2018			2017	
	LTV	READ	net carrying values ¹	LTV	READ
Netherlands	65%	116,984	117,970	70%	118,376
Germany	61%	75,625	77,675	62%	72,104
Belgium, Luxembourg	66%	40,844	40,763	65%	39,048
Australia	59%	34,664	34,404	61%	33,830
Spain	59%	15,105	15,084	59%	13,097
Italy	58%	8,688	8,638	58%	8,478
Poland	61%	7,857	8,046	61%	6,691
Turkey	51%	589	587	54%	920
Romania	69%	1,765	1,753	69%	1,486
Total	63%	302,121	304,922	67%	294,033

1 The net carrying values correspond to the original exposure (on and off-balance) pre-credit conversion factors corrected for allowances, impairments and provisions.

The sustained benign economic environment in most countries supported the housing markets, resulting in increased house prices and improved LTVs, especially in the Netherlands. In the Netherlands, the average Dutch house price increased to EUR 298,000 in December 2018 from EUR 269,000 in December 2017, which led to an improved LTV through indexation. Most countries showed an increased READ due to growth in the mortgage portfolios.

The decrease in the Netherlands can be explained by repayments which were not compensated by new production and the continued transfer of mortgages from WestlandUtrecht Bank to Nationale Nederlanden Bank. In Belgium, there was a slight increase in the LTV, caused by new production at higher LTVs. Of the reduction in Turkey, EUR 97 million can be attributed to the devaluation of the TRY by 25% against the EUR and the remainder to a reduction in new production in the wake of elections and economic volatility.

Off-balance items

Undrawn commitments

The figures below represent the potential exposure that may be drawn by ING's obligors under committed facilities. In most cases, the obligors have the right to draw under these facilities unless an event of default has occurred, or another event as defined in the relevant credit risk agreement has occurred. Usually, the obligor pays a commitment fee to ING on the unused portion of these facilities. Pre-Settlement, Money Market and Investment limits are generally not committed.

Undrawn commitments							2018	2017
	Central Government s and central banks	Institutions	Corporate	Retail – sec. by imm. property non-SME / on residential prop.	Other retail ¹	Total	Total	
Under SA approach	3	31	1,085	385	2,735	4,238	4,690

Total	5,771	6,957	91,936	11,699	5,524	121,885	112,425	

1 AIRB: Retail – secured by immovable property SME, Retail – Other SME, Retail – non SME; SA: Retail, exposures secured by mortgages on commercial immovable property.

If all of the undrawn commitments would be drawn, ING Group's credit risk outstanding would increase by 17%. For RWA calculation purposes, the EAD models estimate how much of these commitments would be drawn under normal circumstances and increase the EAD accordingly. For uncommitted facilities a similar approach is applied, albeit at a lower rate.

The overall increase in undrawn commitments is in line with the increase in outstanding exposures. The share of SA in the total undrawn commitments reduced.

The single largest increase can be seen in the Corporate 35 to 50% RW band, mainly due to increased revolving credit facilities, limits increased by EUR 12 billion and credit outstanding by EUR 5.9 billion.

Counterparty credit risk (CCR)

The main activities that qualify under counterparty credit risk are derivatives trading activities and securities financing. To mitigate the credit risk of these transactions, ING enters into master agreements such as ISDA master agreements and Global Master Repurchase Agreements (GMRAs) that ensures netting of the outstanding positions. To further eliminate the risk on the netted positions, both ING Bank and its counterparties may agree to pledge additional collateral to each other. Additionally ING started to exchange initial margin amounts with its trading partners in 2017. The actual amount that ING may be required to pledge varies based on ING 's portfolio composition of both derivatives and securities pledged in securities financing transactions, market circumstances, the number of downgrade notches as well as the terms and conditions of future CSAs or other similar agreements.

CCR risk approach

Analysis of the counterparty credit risk exposure by approach

In the table below ING counterparty credit risk portfolio is presented according to the regulatory approach. Under Pillar 1 ING uses the Current Exposure Method (Mark to Market method, in line with CRR art. 274), which is a standard approach prescribed by the regulation. There are no exposures under the advanced, Internal Model Method (IMM) under Pillar1. Under Pillar 2 however ING uses the IMM for FX and interest rate derivatives, which is a risk sensitive approach based on Monte Carlo simulations.

For the calculation of the collateral and securities financing transactions (SFT) exposures, ING uses the financial collateral comprehensive method. There is no contractual cross product netting applied.

Under Pillar 1, according to the Current Exposure Method, the regulatory exposure at default (READ) measure consists of an MTM part and a regulatory prescribed add-on to reflect additional potential future credit exposure of the trade. The exposure at default is calculated on a daily basis to take into account the changes in the MTM value due to market movements and changes in the portfolio composition. This calculation is done on:

- Gross basis (ignoring any collateral received and ignoring any netting between trades).
- Net basis (ignoring any collateral received, but applying netting between trades with a positive and negative MTM in case there is a legally enforceable netting agreement in place).
- Net basis after collateral (subtracting any post haircut value of collateral received, and applying netting between trades with a positive and negative MTM in case there is a legally enforceable netting agreement in place).

In 2018, by following EBA Q&A_2735 interpretation, ING amended the way the variation margin is considered in the after collateral exposure. Therefore, under Pillar 1, variation margin is taken into account in the exposure, while initial margin received is in the LGD parameter when ING calculates the own fund requirement.

READ also takes into account the credit valuation adjustment (CVA) recognised as an incurred write-down in line with art. 273(6) CRR.

EU CCR1 – Analysis of the counterparty credit risk (CCR) exposure by approach

2018	Replacement cost (floored MtM)	Potential future exposure	EAD post-CRM ¹	RWA
Mark to market (Derivatives)	10,853	17,648	25,606	7,193
Financial collateral comprehensive method (for SFT's)			8,825	1,467
Total				8,661

Excluding exposure class Securitizations

EU CCR1 – Analysis of the counterparty credit risk (CCR) exposure by approach

2017	Replacement cost (floored MtM)	Potential future exposure	EAD post-CRM	RWA
Mark to market (Derivatives)	12,361	19,012	26,586	8,114
Financial collateral comprehensive method (for SFT's)			8,281	1,144
Total				9,258

Excluding exposure class Securitizations.

The EAD and RWA measures of the counterparty credit risk portfolio did not change significantly during the year. The minor volume increase was offset by the methodology changes mentioned above. Latter had impact on the PFE too, as the variation margin mitigated the components of the PFE. The process that started in 2017 with slow increase of interest rates persisted in 2018. The drop of MtM during the year reflects this trend.

Standardised approach – CCR exposures by regulatory portfolio and risk

The following table presents the CCR exposures that are calculated according the Standardised approach (SA):

EU CCR3: Standardised approach - CCR exposures by regulatory portfolio and risk						
2018						
Exposure Class	Risk weight					Total
	20%	50%	75%	100%	150%	
Regional governments or local authorities	4					4
Institutions	62	33				96

Excluding exposure class Securitisations

The main purpose of the derivatives portfolio of ING is to facilitate the hedging of the mortgage lending portfolio as well as hedging for clients.

As mentioned in the introduction of the chapter, ING changed the methodology how variation margin is taken into account. That is the main driver behind the significant decrease in the interest rate and foreign exchange derivative portfolio. They give the majority (82%) of the total derivative exposure.

It must also be noted that - in line with regulatory requirement - ING novated the bulk of its new trades via qualifying central counterparties (CCPs), which compresses the exposure via the use of the large netting pool of a CCP.

Over-the-counter and exchange traded derivatives

This section quantifies the size of the derivatives exposure in terms of notional value. It also shows whether derivatives are traded over-the-counter (OTC) or traded on recognised exchanges (ETD). Where the derivatives are OTC, the table shows how much is cleared by central counterparties.

Credit risk from derivative transactions

	2018	2017
	Notional	Notional
OTC derivatives		
CCP	2,248,857	2,230,063
Non-CCP	1,378,854	1,535,587
ETD derivatives	27,061	35,287
Total	3,654,772	3,800,937

At the end of 2018, in line with EMIR regulations, close to 62% of the derivative portfolio (based on notional value) was novated via a central counterparty. 20% of the non-cleared trades were uncollateralized, which mainly relate to corporates with small credit limits and mainly comprise of interest rate derivatives and FX Derivatives.

Among the collateralised, but not cleared trades 86% are under a bilateral CSA. Unilateral CSA agreements relate to agreements that are unilateral against ING and mainly consist of Interest Rate Derivatives with Sovereign counterparties.

Securities financing by product type

The exposures in this table are calculated based on the Financial Collateral Comprehensive Method as described in CRR art. 223, where regulatory haircuts are used for exposure and collateral and where netting is applied whenever there is a master netting agreement in place with a positive legal netting opinion.

Securities financing by product type in READ

	Sovereigns	Institutions	Corporate	2018	2017
				Total	Total
Bond Financing Given	37	6,957	738	7,732	6,114
Equity Financing Given		3,796	1,079	4,875	5,172
Bond Financing Taken	84	1,079	796	1,959	1,766
Equity Financing Taken		952	564	1,516	715
Total (ALL)	121	12,784	3,177	16,082	13,767

Includes both AIRB and SA portfolios; excludes Securitisations, equities and ONCOA.

Impact of netting and collateral held on exposure values

Impact of netting

It is common practice in OTC derivatives trading to sign master agreements that allow for close-out netting in the event that one of the parties defaults. When ING has signed such a master agreement and a positive legal netting opinion is in place, the agreement is deemed to be legally enforceable. For trades done under such a legally enforceable netting agreement, it is possible to calculate the exposure on a net basis.

EU CCR5-A: Impact of netting and collateral held on regulatory exposure values

2018	Gross positive fair value	Netting benefits	Netted current credit exposure	Collateral held	Net credit exposure post collateral
Derivatives	103,297	72,472	30,825	5,219	25,606
Securities Financing Transactions	43,875	27,638	16,237	7,412	8,825
Total	147,172	100,110	47,062	12,631	34,431

Excluding exposure class securitization

EU CCR5-A: Impact of netting and collateral held on regulatory exposure values

2017	Gross positive fair value	Netting benefits	Netted current credit exposure	Collateral held	Net credit exposure post collateral
Derivatives	112,186	78,646	33,540	6,953	26,586
Securities Financing Transactions	37,975	24,209	13,767	5,486	8,281
Total	150,161	102,855	47,306	12,439	34,867

Excluding exposure class securitization

The different treatment of variation margin (mentioned earlier) explains the large decline in derivatives collateral held.

Collateral

The change in the actual amount that ING had to pledge can be observed in the following table.

EU CCR5-B: Composition of collateral for exposures to counterparty credit risk

2018		Collateral used in derivative transactions				Collateral used in SFT's	
		Fair value of collateral received		Fair value of posted collateral		Fair value of collateral received	Fair value of posted collateral
		Segregated	Un-Segregated	Segregated	Un-Segregated		
	Cash	667	5,012	-3,398	-7,081		
	Securities	1,317	1,270	-2,054	-269		
	Total	1,984	6,282	-5,452	-7,350	121,597	-106,815
2017	Total	1,029	7,067	-4,792	-8,155	116,780	-88,217

The change in collateral posted and received on the derivatives portfolio is mainly coming from increase in the amount of IM collateral due to EMIR regulations kicking in and ING Bank NV going on to the ISDA SIMM model for exchanging IM. The bulk of collateral posted/received is in government bonds both for OTC derivatives and SFT. ING's key drivers of the changes to the collateralized derivatives portfolio are Interest- and Foreign Exchange Risk. A one notch rating downgrade will not lead to a material outflow of collateral. Additional outflows are taken into account in the Liquidity Coverage Ratio if ING would be downgraded by three notches.

Central Counterparties

In line with EMIR regulation - for standard products - the use of Central Clearing Parties (CCPs) is mandatory and thus increasing part of the portfolio is shifting from bilateral trades to CCPs.

The table below presents the exposures to central counterparties, broken down by qualified (QCCP) and non-qualified CCPs:

EU CCR8: Exposures to central counterparties		
2018	EAD (post-CRM)	RWA
Exposures to QCCPs (total)		
Exposures for trades at QCCPs (excluding initial margin and default fund contributions); of which	8,397	168
(i) OTC derivatives	7,209	144
(ii) Exchange-traded derivatives	439	9
(iii) Securities financing transactions	749	15
Pre-funded default fund contributions	185	244
Exposures to non-QCCPs (total)		
Exposures for trades at non-QCCPs (excluding initial margin and default fund contributions); of which		
(i) OTC derivatives		
(ii) Exchange-traded derivatives		
(iii) Securities financing transactions		
Pre-funded default fund contributions	185	244

EU CCR8: Exposures to central counterparties		
2017	EAD (post-CRM)	RWA
Exposures to QCCPs (total)		
Exposures for trades at QCCPs (excluding initial margin and default fund contributions); of which	8,233	165
(i) OTC derivatives	6,805	136
(ii) Exchange-traded derivatives	544	11
(iii) Securities financing transactions	884	18
Pre-funded default fund contributions	212	376

Notes:

(1) By definition segregated initial margin does not contribute to exposure

(2) The status "qualified" is based on the European Securities and Markets Authority (ESMA) qualification. ING clears with the following QCCPs: Banque Centrale de Compensation SA, Banque Centrale de Compensation SA, LCH CDS Clear SA, Chicago Mercantile Exchange Inc, EUREX Clearing Aktiengesellschaft, EUREX OTC CLEAR, ICE Clear Europe Ltd, Japan Securities Clearing Corp, KDPW_CCP SA

LCH Limited, Equity Clear Service, LCH Ltd, Forexclear service, LCH.Clearnet Repoclear service, LCH.Clearnet Swapclear service, LME Clear Ltd, The Korea Exchange, The Options Clearing Corporation.

Voluntary and mandatory clearing has a large impact on the development of EAD and RWA. From an EAD perspective many trades are concentrated in one netting set (per CCP service), compared to bilateral trading, where trades are in various netting sets. Novating a bilateral traded contract to a CCP therefore typically reduces the amount of EAD. From an RWA perspective, the novation reduces the amount of RWA even more, due to the fact that the risk weight is only 2% (for QCCP exposure).

CVA risk

ING follows the standardised approach for calculating the own fund requirement for CVA Risk. The scope of products and counterparties follows the European regulations (CRR and EMIR).

EU CCR2 – CVA capital charge

	Exposure value	2018 RWAs	Exposure value	2017 RWAs
Total portfolios subject to the advanced method				
All portfolios subject to the standardised method	6,558	553	7,931	2,754
Based on the original exposure method				
Total subject to the CVA capital charge	6,558	553	7,931	2,754

There are two drivers that marginalized CVA Capital charge in 2018 compare to 2017. On the one hand the exposure decreased due to (i) increased use of EMIR collaterals, (ii) new methodology how the variation margin is reflected and (iii) decreased proportion of uncleared derivative transactions with financial counterparties. However the major factor behind the RWA reduction is ING decision to take into account CDS hedges in the capital calculation.

Credit default swaps

ING participates in the credit risk derivative trading market, as a net purchaser of credit risk protection from other counterparties.

EU CCR6: Credit derivatives exposures

	2018	Protection bought	Protection sold
Notionals			
Single-name credit default swaps		-15,176	13,212
Index credit default swaps		-1,433	430
Total return swaps		0	1,852
Total Notionals		-16,609	15,494
Fair values		-36	30
Positive fair value (asset)		132	142
Negative fair value (liability)		-168	-112

EU CCR6: Credit derivatives exposures

	2017	Protection bought	Protection sold
Notionals			
Single-name credit default swaps		-15,684	13,226
Index credit default swaps		-1,188	607
Total return swaps			1,523
Total Notionals		-16,872	15,356
Fair values		-196	195
Positive fair value (asset)		29	208
Negative fair value (liability)		-225	-13

For ING's credit derivative positions as of 31 december 2018, the largest notional is under single-name credit default swap (CDS), and a small notional is under Index CDS (IXCDS).

Compared to 2017, the absolute total notional remained stable for both protection bought and protection sold. For protection bought, the total fair value became less negative in 2018 compared to 2017, mainly due to an increase in the positive fair value of the sovereign positions. On the other hand, the fair value of protection sold became less positive in 2018 compared to 2017, mainly caused by a decrease in the negative fair value of the sovereign positions.

Credit risk mitigation

ING's lending and investment businesses are subject to credit risk. As such, the creditworthiness of our customers and investments is continually monitored for their ability to meet their financial obligations to ING Bank. In addition to determining the credit quality and creditworthiness of the customer, ING uses various credit risk mitigation techniques and instruments to mitigate the credit risk associated with an exposure and to reduce the losses incurred subsequent to an event of default on an obligation a customer may have towards ING. The most common terminology used in ING for credit risk protection is 'cover'. While a cover can be an important method for mitigation of credit risk and an alternative source of repayment, generally it is ING's practice to lend on the basis of the customer's creditworthiness rather than exclusively relying on the value of the cover. Within ING, there are two distinct forms of covers: assets and third party obligations.

Cover forms

Assets

The asset that has been pledged to ING as collateral or security gives ING the right to liquidate it in the event where the customer is unable to fulfil its financial obligation. As such, the proceeds can be applied towards full or partial payments of the customer's outstanding exposure. An asset can be tangible (such as cash, securities, receivables, inventory, plant & machinery and mortgages on real estate properties) or intangible (such as patents, trademarks, contract rights and licenses).

Third party obligation

Third Party Obligation, indemnification or undertaking (either by contract and/or by law) is a legally binding declaration by a third party that gives ING the right to expect and claim from that third party to pay an amount, if the customer fails on its obligations to ING. The most common examples are guarantees (such as parent guarantees and export credit insurances) and letters of comfort.

Cover valuation methodology

General guidelines for cover valuation are established to ensure consistency of the application within ING. These general guidelines also require that the value of the cover is monitored on a regular basis, in principle at least annually. Covers shall be revalued accordingly and whenever there is reason to believe that the market is subject to significant changes in conditions. The frequency of monitoring and revaluation depends on the type of covers.

The valuation method also depends on the type of covers. For asset collateral, the valuation sources can be the customer's balance sheet (e.g. inventory, machinery, and equipment), nominal value (e.g. cash, receivables), market value (e.g. securities and commodities), independent appraiser (commercial real estate) and market indices (residential real estate). For third party obligations, the valuation is based on the value which is attributed to the contract between ING and that third party.

For the determination of the Credit Risk applicable amount for Pre-Settlement transactions, ING first matches trades with similar characteristics to determine their eligibility for offset. This offsetting effect is called 'compensation'. Subsequently, ING reduces the amount by any legal netting that may be permitted under various types of Master Agreements (such as ISDAs and GMRAs). Lastly, the amount is further reduced by any collateral that is held by ING under CSAs or other similar agreements.

For the other risk types and especially lending, covers are received which are intended to reduce the losses incurred subsequent to an event of default on an obligation a customer may have towards ING. These are subdivided into four groups called collateral values mortgages, cover values cash, cover value guarantees and other physical covers.

The table below presents the ING portfolio excluding equities per loan type. Exposures represent the outstanding and a loan is presented as secured by collateral or a guarantee if such a cover exists on a facility type. The secured amounts represent the part of the loan that is covered by the collateral. If a loan has both collateral and a guarantee than these are both shown in the designated column.

Credit Risk Mitigations techniques – overview

The table below presents the extent of the use of CRM techniques. All collaterals and financial guarantees are included for all secured exposures, irrespective of whether the standardized approach or the IRB approach is used for RWA calculation. In the column *Exposures unsecured – Carrying amount* are the exposures (net of allowances/impairments) that do not benefit from a CRM technique. In the column *Exposures to be secured* are the exposures that have at least one CRM mechanism (collateral, financial guarantees, credit derivatives) associated with them.

EU CR3: Credit risk mitigation techniques - overview

	Exposures unsecured: carrying amount	Exposures to be secured	Exposures secured by collateral	Exposures secured by financial guarantees
2018				
Total loans	624,037	411,070	364,627	46,443
Total debt securities	173,828	644	566	78
Total exposures	797,865	411,714	365,193	46,521
<i>Of which defaulted</i>	4,003	3,981	3,488	493

Includes the AIRB and SA portfolios and excludes the Default Fund Contribution, securitisations, CVA RWA, equities and ONCOA.

EU CR3: Credit risk mitigation techniques - overview

	Exposures unsecured: carrying amount	Exposures to be secured	Exposures secured by collateral	Exposures secured by financial guarantees
2017				
Total loans	584,461	379,782	339,397	40,385
Total debt securities	163,425	95		95
Total exposures	747,886	379,876	339,397	40,480
<i>Of which defaulted</i>	4,540	4,654	4,298	356

Includes the AIRB and SA portfolios and the Default Fund Contribution, excludes securitisations, CVA RWA, equities and ONCOA.

Over the year, there was a slight increase in the covered amounts, from 46% to 45% of total exposures. For more information on the covers, please see the section 'credit risk mitigation' part of the Risk Management paragraph of the ING Bank Annual Report 2018.

Securitisations

The following is prepared taking into account the 'Industry Good Practice Guidelines on Pillar 3 disclosure requirements for securitisations' issued by the European Banking Federation and other industry associations on 31 January 2010 and the CRR/CRD IV disclosure requirements. It includes qualitative and quantitative disclosures addressing both the exposure securitised as well as securitisations positions held. While quantitative disclosures are limited to those securitisations that are used for the purpose of calculating the regulatory capital requirements under the CRR/CRD IV, qualitative information have a broader scope and give a view on ING's entire securitisation activity.

Depending on ING's role as investor, originator, or sponsor, the objectives, the involvement and the rules applied may be different. ING is primarily engaged in securitisation transactions in the role of investor (in securitisations arranged by others). To a lesser extent, ING is also an originator or sponsor of securitisations that are usually traded in the public markets. ING does not re-securitise its securitisations exposure and even though ING hedges its securitisation positions, such instruments are not recognized as credit risk mitigation for regulatory capital purposes. ING does not engage in securitisation of any impaired assets from its own balance. Furthermore, ING does not have any securitisation position in its trading book.

Valuation and accounting policies

ING's activities regarding securitisations are described in Note 50 'Structured entities' in the annual accounts. The applicable accounting policies are included in the section 'Accounting policies for the consolidated annual accounts of ING Group' in the annual accounts. The most relevant accounting policies for ING's own originated securitisation programmes are 'De-recognition of financial assets' and 'Consolidation'. Where ING acts as investor in securitisation positions, the most relevant accounting policy is 'Classification of financial instruments'.

Regulatory capital method used and Rating Agencies

ING has implemented the AIRB approach for credit risk. As a consequence, ING uses the Rating Based Approach (RBA) for investments in tranches of asset-backed securities (ABS) and mortgage-backed securities (MBS) which have been rated by external rating agencies. Rating agencies which are used by ING under the RBA include Standard & Poor's, Fitch and Moody's. The securitisation exposure for which each rating agency is used is given in the following table. In case of multiple ratings, the worst rating is applied.

ING uses the Internal Assessment Approach (IAA) for the support facilities it provides to Asset Backed Commercial Paper (ABCP) conduit Mont Blanc Capital Corp., based on externally published rating agency methodologies. Under the IAA approach, the unrated position is assigned by the institution to an internal rating grade, which is estimated using an ING developed model. The individual liquidity facilities are then attributed a derived rating by mapping the internal rating grade to an externally published credit assessments corresponding to that rating grade.

Securitisation exposure per rating agency used

						2018	2017
	S&P	Fitch	Moody's	IAA approach	Other	Total	Total
Asset Backed Securities	1,520	344	373			2,237	3,446
Residential Mortgage Backed Securities	3,000	533	251		96	3,879	1,202
Securitisation Liquidity				1,181		1,181	1,139
Interest Rate Derivatives				281		281	364
Other		4		384		388	325
Total	4,520	881	624	1,846	96	7,966	6,476

Under the RBA, RWA are determined by multiplying the amount of the exposure by the appropriate regulatory risk weights, which depend on: the external rating or an available inferred rating, the seniority of the position and the granularity of the position.

Securitisations - credit risk disclosure in READ

	2018	2017	Delta %
Geography	7,966	6,476	23.0%

Securitisation Investor	3,259	4,661	-30.1%
Securitisation Sponsor	1,846	1,815	1.7%

Excludes equities and ONCOA.

- These are structured financing transactions by ING for clients by assisting them in obtaining sources of liquidity by selling the clients' receivables or other financial assets to an SPV.
- Securitisation benefits are excluded. Own originated securitisations are explained in a separate section.

During 2018 the exposure to securitisations increased from EUR 6.5 billion to EUR 8.0 billion mainly caused by finalizing a synthetic securitisation as originator. All assets in the securitisation portfolio are performing.

Investor securitisations

ING's goal is to maintain a portfolio of high quality liquid assets that meets the regulatory requirements of CRR/CRD IV and the Delegated Act of October 2014 regarding liquidity. ING invests in high quality Asset Backed Securities (ABS) keeping close track of the securitisation investment positions via monthly monitoring reports and weekly update calls. Additionally, ING may invest in securitisation positions in order to facilitate client business from Wholesale Banking Securitisation department.

In the next table, the investor securitisations are given, broken down by underlying exposure.

In 2018, the total Securitisation Investment portfolio decreased with EUR 1,4 billion to EUR 3,3 billion. The biggest decrease was in Other retail Exposures of EUR 1.2 billion to EUR 0.8 billion, this is the result of de-risk in Student Loans.

Investor securitisation activities			
		2018	2017
	Traditional	Total	Total
Residential mortgage	1,193	1,193	1,225
Other retail exposures	887	887	2,127
Loans to corporates	61	61	8
Commercial mortgage			
Lease and receivables	1,118	1,118	1,301
Re-securitisation			
Total	3,259	3,259	4,661

The following table provides the breakdown of current exposures by risk weight bands. The amount of securitisation positions is based on the regulatory exposure values calculated according to the CRR/CRD IV after consideration of credit conversion factors (CCFs) where applicable as used for the purpose of Pillar 1, but prior to the application of credit risk mitigates on securitisation positions. Given the focus on high quality securitisations the portfolio composition is shifting to the lower risk band.

Investor securitisation activities				
	2018		2017	
	READ	RWA	READ	RWA
Risk weight band 1 <= 10%	2,711	206	4,194	317
Risk weight band 2 >10% and <= 18%	481	80	185	22
Risk weight band 3 >18% and <= 35%	67	12	270	56
Risk weight band 4 >35% and <= 75%				
Risk weight band 5 >75% and <1250%			10	24
Risk weight 1250%		6	1	16
Total	3,259	304	4,661	434

Capital requirements for investment positions in securitisations

		Traditional securitisation			Total exposure 2018	Total exposure 2017
		Total traditional	Of which retail underlying	Of which non-retail underlying		
Exposure values (by RW bands)	<= 20% RW	3,259	3,198	61	3,259	4,650
	>20% to 50% RW					
	>50% to 100% RW					2
	>100% to <1250% RW					8
	1250% RW				0	1
	Total	3,259	3,198	61	3,259	4,661
Exposure values (by regulatory approach)	IRB RBA (incl. IAA)	3,259	3,198	61	3,259	4,660
	1250% Risk Weight	0	0	0	0	1
	Total	3,259	3,198	61	3,259	4,661
RWA (by regulatory approach)	IRB RBA (incl. IAA)	298	290	7	298	419
	1250% Risk Weight	6	6		6	16
	Total	304	296	7	304	435
Capital charge after cap	IRB RBA (incl. IAA)	24	23	1	24	33
	1250% Risk Weight				0	2
	Total Capital	24	24	1	24	35

Excludes equities and ONCOA. ING does not have any re-securitisation in its books.

In the table above an overview of Investor Securitization exposures and their respective capital requirements are shown. In line with ING's policy and Risk Appetite the vast majority of positions are rated AA- and above, and almost the entire portfolio remains within the investment grade.

Sponsor securitisations

In the normal course of business, ING structures financing transactions for its clients by assisting them in obtaining sources of liquidity by selling the clients' receivables or other financial assets to a Special Purpose Vehicle (SPV). The senior positions in these transactions are funded by the ING administered multi seller Asset Backed Commercial Paper (ABCP) conduit Mont Blanc Capital Corp. (rated A-1/P-1). Mont Blanc Capital Corp. funds itself externally in the ABCP markets.

In its role as administrative agent, ING facilitates these transactions by acting as administrative agent, swap counterparty and liquidity provider to Mont Blanc. ING also provides support facilities (liquidity) backing the transactions funded by the conduit. The types of asset currently in the Mont Blanc conduit include trade receivables, consumer finance receivables and car leases.

ING supports the commercial paper programmes by providing Mont Blanc Capital Corp. with short-term liquidity facilities. Once drawn these facilities bear normal credit risk.

The liquidity facilities, provided to Mont Blanc are EUR 1,173 million. There was no drawn liquidity amount at 31 December 2018. Mont Blanc has no investments in securitisation positions that ING has securitised.

The standby liquidity facilities are reported under irrevocable facilities. All facilities, which vary in risk profile, are granted to the SPE subject to normal ING credit and liquidity risk analysis procedures. The fees received for services provided and for facilities are charged subject to market conditions. Mont Blanc is consolidated by ING. These transactions are therefore on-balance sheet arrangements.

In line with the Internal Assessment Approach, which has been approved for use by ECB for ING in relation to the ING sponsored ABCP conduit, Mont Blanc Capital Corp, the credit quality of the positions are internally assessed by following publicly available assessment methodology of external rating agencies. This includes differing stress factors for different asset classes as outlined by rating agencies as well as assessing the entire structure of the transaction including additional quantitative and qualitative features. This will result in the calculation of a certain credit enhancement. Other protections in a transaction (eligibility criteria, early amortization triggers, commingling protections etc.) are factored in that results in an internal rating. This rating is then directly mapped to an external rating which is used to determine the RWA for the liquidity facilities provided by ING to support the transactions and is outlined in a defined approach. Any changes to rating agency methodology is tracked annually with a procedure in place with the credit risk measurement department verifying that any changes are captured in an update to the approach.

The credit approval process for individual transactions follows ING's standard credit approval procedures. At inception, initial data is required to be received outlining the historical performance of the assets. Due diligence is carried out on the underlying asset pool. Following ING policy, each transaction is reviewed (including reassessing the internal assessment approach analysis for that transaction) on a regular basis. The performance of each transaction is closely monitored on an ongoing basis through a.o. detailed transaction reports.

Originator securitisations

ING originates own securitisation transactions for economic and regulatory capital purposes, as well as liquidity and funding purposes.

Liquidity and funding

The senior tranches in securitisations are used to obtain funding and/or provide contingent liquidity. To be eligible as collateral for central banks securitised exposures must be sold to a Special Purpose Vehicle (SPV) which, in turn, issues securitisation notes ('traditional securitisations') in two tranches, one subordinated tranche and one senior tranche, rated AAA by a rating agency. The AAA tranche can then be used by ING as (stand-by) collateral in the money market for secured borrowings. The assets awaiting securitisations are originated from a banking book and are valued in line with the respective accounting framework. In principle, loans that are securitised are valued at cost.

ING has created a number of these securitisations with a 31 December 2018 position of approximately EUR 66 billion of AAA rated notes and unrated subordinated notes. The underlying exposures are residential mortgages in the Netherlands, Belgium, Spain, Italy and Australia and SME Loans in Belgium.

As long as the securitisation exposures created are not transferred to third parties, the regulatory capital remains unchanged. These are not detailed hereunder. Apart from the structuring and administration costs of these securitisations, these securitisations are profit / loss neutral.

Simple risk weight method

A small part of the equity exposure of ING's portfolio is subject to the simple risk weight method for calculating the regulatory capital. The table below shows more details on the equity exposure for which the simple risk weight method is used.

EU CR10: IRB (specialised lending and equities) - Equities under the simple risk-weighted approach									
	On balance sheet amount		RW	Exposure amount		RWA		Capital requirements	
	2018	2017		2018	2017	2018	2017	2018	2017
Exchange traded equity exposures	954	1,002	290%	954	1,002	2,766	2,904	221	232
Private equity exposures	572	521	190%	572	521	1,087	990	87	79
Other equity exposures			370%						
Total	1,526	1,523		1,526	1,523	3,853	3,894	308	311

In 2018, the total value of ING Bank equity investments reported under simple risk weighted approach has increased by EUR 3 million to EUR 1,526 million (2017: EUR 1,523 million). The increase is mainly driven by assets under 190% risk weight category (+EUR 51 million), such as a new acquired equity stakes, as well as share price movements and value adjustments of the outstanding equity stakes. This was offset by EUR 48 million decrease in equity assets under 290% risk weight, caused mainly by the sale of 0.67% of Kotak Mahindra shares in November 2018.

On the contrary, the total RWA and Regulatory Capital decreased by EUR 41 million and EUR 3 million respectively. This is driven by a higher impact coming from the decreased RWA for assets value under 290% risk weight category versus the impact coming from the increase in assets value under 190% risk weight in RWA.

Market risk

Prudent Valuation Adjustments

The fair valued instruments of ING portfolio are subject to valuation adjustments, supported by a bank-wide valuation policy framework which meets both IFRS and CRR requirements. In addition to the valuation adjustments reflected in the P&L, an adjustment for fair valued concentrated positions is recognised in the Tier 1 capital (i.e. Concentration AVA), in compliance with EBA regulatory standards and IFRS.

Adjustment on concentrated position

	Equity	Interest rates	FX	Credit spread	Commodities	Total	2018		2017		
							Of which: in the trading book	Of which: in the banking book	Total	Of which: in the trading book	Of which: in the banking book
Concentration AVA	184	2	0	18,292	0	18,478	16,391	2,087	17,524	16,910	614

As of 31 December 2018, the Concentration AVA totalled EUR 18.5 million (before tax). This is an increase of EUR 1.0 million when compared to year-end 2017 (EUR 17.5 million before tax; EUR 13 million after tax) mainly driven by fair valued bonds held by the banking book as a result of IFRS 9 reclassification effective since 2018. On a quarterly basis the Concentration AVA, as well as all other valuation adjustments, is discussed and approved in the Global Pricing and Impairment Committee (GP&IC), who oversees the bank-wide valuation framework.

Market RWA under the internal model approach (IMA)

The table below explains the changes in Market RWA under the Internal Model Approach (IMA) during 2018 and provides additional information by linking the impact of changes in portfolio composition, model changes, and shifts in the risk environment on Market RWA.

EU MR2-B: RWA flow statements of market risk exposures under the IMA

amounts in EUR millions

	VaR	SVaR	IRC	Total RWA	2018		2017	
					Total capital requirements	Total RWA	Total capital requirements	Total RWA
1 RWA at previous year end	649	1,750	1,205	3,604	288	5,579	446	446
1a Regulatory adjustment	440	908	224	1,572	126	2,575	206	206
1b RWA at previous year-end (end of the day)	209	842	981	2,032	163	3,003	240	240
2 Movement in risk levels	320	645	-254	710	57	-972	-78	-78
8a RWAs at the end of the reporting period (end of the day)	529	1,486	727	2,742	219	2,032	163	163
8b Regulatory adjustment	866	1,730	40	2,636	211	1,572	126	126
8 RWA at the end of the reporting period	1,394	3,217	767	5,378	430	3,604	288	288

* It is required to fill in Rows 1a/1b and 8a/8b when the RWA/capital requirement for any of the columns (VaR, SVaR, IRC) is the 60-day average (for VaR and SVaR) or the 12-week average measure (for IRC) and not the RWA/capital requirement at the end of the period. According to regulatory guidelines the values in rows 1a/8b are calculated as differences between values in rows 1 and 1b and 8 and 8a, respectively.

** Movement in risk levels: Changes due to position changes between end-of-day values for two reporting periods in question.

Key changes

The ING Bank Market RWA under Internal Model Approach increased to EUR 5.4 billion in 2018 from EUR 3.6 billion in 2017 (+1,774 million), mainly driven by risk position changes. The components of the change are: 10D HVaR (EUR +745 million), 10D SVaR (EUR +1,467 million), while IRC decreased (EUR -438 million). The change in IRC is mainly due to a decrease in IRC default as a result of decreased debt positions in sovereigns and financials.

Funding & liquidity risk

Funding and liquidity risk is the risk that ING Bank or one of its subsidiaries cannot meet its financial liabilities when they come due, at reasonable cost and in a timely manner.

As part of the liquidity buffer management, ING Bank monitors the existing asset encumbrance. Encumbered assets represent the on- and off-balance sheet assets that are pledged or used as collateral for ING Bank's liabilities. The presented templates of ING Bank's encumbered and unencumbered assets are based on the CRR (Part Eight) and the related guidance from the European Banking Authority (EBA).

In 2018, the median asset encumbrance ratio for ING Bank is 19%.

ING Bank: Encumbered and unencumbered assets

	Carrying amount of encumbered assets	Fair value of encumbered assets	Carrying amount of unencumbered assets	Fair value of unencumbered assets
2018 median				
Assets of ING Bank	101,510		794,308

of which: covered bonds	25,792	36,160
of which: asset-backed securities	5,672	6,770

Information on importance of encumbrance ING Bank

ING Bank manages its balance sheet prudently whereby a variety of funding sources is readily available. Given this situation, the level of encumbrance of ING Bank's balance sheet is relatively low.

Encumbered assets on ING Bank's balance sheet comprise to a large extent mortgages and other loans which are used as cover pool for covered bond programs issued by subsidiaries in the Netherlands, Belgium and Germany, as well as external securitisations and other types of collateralized deposits. Of the total encumbered assets of the Bank, EUR 80 billion are loans and advances, mostly mortgages, that serve as collateral for these type of liabilities. The cover pool assets are not considered encumbered when the securities are retained within ING BANK. The issued securitisations and especially the covered bonds have over collateralisation, meaning that the assets in the cover pool are higher than the issuance.

Furthermore, assets are encumbered as a result of the repo- and securities lending business and cash and securities collateral posted for derivative and clearing transactions in which pledging collateral is a requirement. As part of its normal securities financing and derivatives trading activities ING enters into standard master agreements such as ISDA and Global Master Repurchase Agreements (GMRA), which contain Credit Support Annexes (CSA) or other similar clauses. Under the terms of these contracts ING could be required to provide additional collateral in the event ING is downgraded by one of the established rating agencies. Refer to the paragraph Counterparty Credit Risk.

The main part of ING Bank's repo- and reverse repo activities are short-term dated. Repo transactions are mostly conducted with securities which have been obtained as collateral in reverse repo transactions, which are not recognized on the balance sheet. Where securities recognized on the balance sheet have been used in a repo transaction, these remain recognized on the balance sheet and are reported as encumbered.

Non-Financial Risk

The table below shows the distribution of the gross loss amount for non-financial risk events by the Basel risk categories. The Basel risk categories (i.e. Basel event type classifications) include the risk areas set out in the Non-Financial Risk chapter. The event loss is presented in the year of discovery of the individual events.

Distribution of gross loss* by risk category

	2018	2017**
Business disruption and systems failures	1	1
Clients, products and business practices	16	115
Damage to physical assets	2	1
Employment practices and workplace safety	7	2
Execution, delivery and process management	24	55
External fraud	20	20
Internal fraud	2	
Total	72	194

* Loss amounts for events with an individual loss \geq EUR 5,000.

** Due to recoveries and the development of loss amounts over time, the figures of previous years can be subject to change.

In 2018, the internal event losses were mainly in the categories Execution, Delivery and Process management (33%), External fraud (28%) and Clients, Products and Business practices (22%). These amounts do not include additional losses to events that were reported before 2018, which include the settlement of EUR 755 million reached with the Dutch Public Prosecution Service, related to an event first identified and internally reported in 2016.

The 2017 losses to events are lower than previously reported due to a net release of provisions amounting to EUR 10 million. In 2017, the highest loss amounts were in the risk category Clients, Products & Business Practices (59%) and Execution, Delivery & Process Management (29%).

Whistleblower

ING deems it important that any employee can report, anonymously or not, alleged irregularities ('Concerns') regarding accounting or auditing matters, as well as Concerns of a general, operational and financial nature within the company, in accordance with its Whistleblower Policy. ING exercises the utmost care with regard to the confidentiality of such a report or the anonymity of the employee, within the limits as defined by applicable laws and regulations. ING will not discharge, demote, suspend, threaten, harass or in any other way harm the employment status of a Whistleblower who has reported a Concern in good faith or of an employee who participates or has participated in an investigation following a reported Concern.

Concerns are recorded in accordance with specific categories, as represented in the table. These are limited to concerns reported through the dedicated whistle-blower channels as alternative to standard reporting and escalation channels. The Concerns are reported periodically (in numbers and on content, if necessary) via the Head of Compliance up to the level of the Supervisory Board.

Whistleblower concerns		
Number of cases	2018	2017
Breach of Orange code or unethical behaviour	45	19
Bribery / Corruption	-	1
Customer suitability	1	-
Financial Economic Crime	6	1
Fraud / Theft	2	9
Privacy or (client) confidentiality	1	3
Other breach of any external law / regulation	18	66
Retaliation	2	1
Total	75	100
